ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Select	Selects an item.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any

Name	Description
	results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

ToolBar Class

Description

The class for tool bar controls. A tool bar is a container for a set of buttons and other standard controls.

Inheritance Hierarchy

- [Control](#)
 - ToolBar

Syntax

```
'Declaration
Public Class ToolBar _
Inherits Control
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from GuiTestObject)
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)

Name	Description
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)

Name	Description
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from IScrollable)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from IScrollable)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject . (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from BaseGuiTestObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)

Name	Description
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

ToolItem Class

Description

The class for a tool item in a toolbar control.

Inheritance Hierarchy

- [Item](#)
 - `ToolItem`
 - [CheckBoxToolItem](#)
 - [DropDownToolItem](#)
 - [PushToolItem](#)
 - [RadioListToolItem](#)

Syntax

The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Tree Class

Description

The class for items organized into graphical hierarchies.

Inheritance Hierarchy

- [Control](#)
 - Tree
 - [SWTTree](#)

Syntax

```
'Declaration
Public Class Tree _
Inherits Control
```

Properties

Name	Description
AllowsCheck	Whether the control can display a checkmark.
AllowsMultiSelect	Whether the control supports selecting multiple items.
Background	The background color of the GUI object. (Inherited from GuiTestObject)
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
ItemCount	The number of items in the tree (including all children).
ItemPaths	A list of items in the tree (including all children).
Items	A list of items in the tree (including all children).
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
SelectedIndex	The index of the first selected item.
SelectedIndices	The indices of the selected item(s).
SelectedItem	The name of the first selected item.
SelectedItems	The names of the selected item(s).
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)
VisibleItemPaths	A list of visible items in the tree (including all children).
VisibleItems	A list of visible items in the tree (including all children).

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Check	Checks the check box.

Name	Description
Click	Clicks on the object. (Inherited from IClickable)
Collapse	Collapses an item in a treeview control.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DoubleSelect	Double-clicks an item.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Expand	Expands an object in a treeview control.
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from IScrollable)
GetItemPaths	Returns all items of the tree as a list of itempaths
GetItemRect	Returns the size and position of an item relative to the treeview control.
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from IScrollable)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)

Name	Description
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsExpandable	Checks if the given item can be expanded.
IsExpanded	Checks if the given item is expanded.
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from BaseGuiTestObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Select	Selects an item from the tree.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)

Name	Description
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
Uncheck	Unchecks the check box.
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

VerticalScrollBar Class

Description

The class for vertical scroll bars.

Inheritance Hierarchy

- [ScrollBar](#)
 - VerticalScrollBar

Syntax

```
'Declaration
Public Class VerticalScrollBar _
Inherits ScrollBar
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from GuiTestObject)
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
PageSize	The internal page size of the scroll bar. (Inherited from ScrollBar)
Position	The actual position of the scroll bar caret. (Inherited from ScrollBar)
Range	The range of the scroll bar. (Inherited from ScrollBar)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)

Name	Description
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>OpenContextMenu</i>	Opens a context menu at the specified position. (Inherited from <i>BaseGuiTestObject</i>)
<i>PageDown</i>	Scrolls the scroll bar page-wise down.
<i>PageUp</i>	Scrolls the scroll bar page-wise up.
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>Scroll</i>	Scrolls the scroll bar. (Inherited from <i>ScrollBar</i>)
<i>ScrollDown</i>	Moves the scroll bar down.
<i>ScrollToMax</i>	Scrolls the scroll bar to its maximum position. (Inherited from <i>ScrollBar</i>)
<i>ScrollToMin</i>	Scrolls the scroll bar to its minimum position. (Inherited from <i>ScrollBar</i>)
<i>ScrollUp</i>	Moves the scroll bar up.
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)

Name	Description
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Window Class

Description

The class for windows that typically can move.

Inheritance Hierarchy

- [BaseGuiTestObject](#)
 - Window
 - [BrowserApplication](#)
 - [Dialog](#)
 - [FlexStandalonePlayer](#)
 - [FormsWindow](#)
 - [Shell](#)
 - [UIAWindow](#)

Syntax

```
'Declaration
Public Class Window _
Inherits BaseGuiTestObject _
Implements IMoveable
```

Properties

Name	Description
Application	The name of the Application that this Window belongs to.
Background	The background color of the GUI object. (Inherited from GuiTestObject)
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)
WindowState	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from IMoveable)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored

Name	Description
	in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
Close	Closes the window. (Inherited from IMoveable)
CloseSynchron	Closes the window and waits until the window is closed. (Inherited from IMoveable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetCloseWindows	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from IMoveable)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject . (Inherited from TestObject)
GetFocus	Returns the object with the input focus. (Inherited from IMoveable)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from IScrollable)
GetNextCloseWindow	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from IMoveable)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from IScrollable)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsActive	Returns whether the window is set to active. (Inherited from IMoveable)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
Maximize	Maximizes the window. (Inherited from IMoveable)
Minimize	Reduces the window to an icon. (Inherited from IMoveable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the window. (Inherited from IMoveable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from BaseGuiTestObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Restore	Restores the window to its previous size. (Inherited from IMoveable)

Name	Description
SetActive	Makes the window active. (Inherited from IMoveable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
Size	Resizes the window. (Inherited from IMoveable)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used.

Name	Description
	An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Core Class Reference

When you configure an application, Silk Test Workbench automatically provides built-in support for testing standard agent and test object controls.

ActiveData Class

Description

`ActiveData` is the class that provides functionality for using an `ActiveData` object in a script. This class is an internal constructor. To call `ActiveData`, call `Workbench.LoadActiveData` instead of using this class.

Inheritance Hierarchy

`ActiveData` does not derive from any class, and no classes derive from it.

Syntax

```
'Declaration
Public Class ActiveData
```

Properties

Name	Description
ColumnCount	The number of columns in the underlying <code>ActiveData</code> object.
Count	The number of columns in an <code>ActiveData</code> row.

Methods

Name	Description
AddColumn	Adds a column to the underlying <code>ActiveData</code> object.
AddRow	Adds a row to the underlying <code>ActiveData</code> object.
Dispose	Cleans up the resources used by the object.
GetEnumerator	Returns an enumerator for the rows.
Item	Returns an <code>ActiveDataRow</code> by index.
RemoveColumn	Removes a column from the underlying <code>ActiveData</code> object.

Name	Description
RemoveRow	Removes a row from the underlying <code>ActiveData</code> object.
RenameColumn	Renames a column in the <code>ActiveData</code> object.
Reset	Moves the focus to the first row of the <code>ActiveData</code> file.
Save	Saves the <code>ActiveData</code> object.

AddColumn Method (ActiveData)

Class

[ActiveData](#).

Action

Adds a column to the underlying `ActiveData` object and returns a value that indicates success or failure.

Syntax

```
AddColumn (defaultValue, columnName)
```

Variable	Description
<code>defaultValue</code>	The default value for the new column. <code>Double</code> .
<code>columnName</code>	The name of the column. <code>String</code> .

Examples

To add a new column called "Occupation" to the `PhoneBookData` asset, type the following:

```
Public Sub Main()
    AddColumnToDataFile( "occupation" )
End Sub

Public Sub AddColumnToDataFile( name As String )
    Dim data As ActiveData = Workbench.LoadActiveData( "PhoneBookData" )
    data.AddColumn( "Occupation", name )
    data.Save()
End Sub
End Module
```

AddRow Method (ActiveData)

Class

[ActiveData](#).

Action

Adds a row to the underlying `ActiveData` object and returns a value that indicates success or failure.

Syntax

```
AddRow ( )
```

Examples

To add a new row of data for ID number, type the following:

```
Public Sub Main()  
    InsertNewNumberToDataFileWithOccupation( 108, "Jay", "Jones",  
"5551219", _  
    "QA Analyst" )  
End Sub  
  
Public Sub InsertNewNumberToDataFileWithOccupation( id As Integer, _  
    firstName As String, lastName As String, phoneNumber As String, _  
    occupation As String )  
    Dim data As ActiveData = Workbench.LoadActiveData( "PhoneBookData" )  
    Dim row As ActiveDataRow = data.AddRow()  
  
    row.SetLong( "id", id )  
    row.SetString( "fname", firstName )  
    row.SetString( "lname", lastName )  
    row.SetString( "number", phoneNumber )  
    row.SetString( "occupation", occupation )  
  
    data.Save()  
End Sub  
End Module
```

Dispose Method (ActiveData)

Class

[ActiveData](#).

Action

Cleans up the resources used by the object.

Syntax

```
Dispose ( )
```

Notes

The only time that you should use this method is when you are reading and writing to a file from multiple scripts.

 **Caution:** In all cases except previously mentioned, do not use this method. Silk Test Workbench automatically calls this method when it is needed.

Example

```
Dim a As ActiveData  
a = Workbench.LoadActiveData("ActiveDataAsset")  
' Do your work here  
a.Dispose()
```

GetEnumerator Method (ActiveData)

Class

[ActiveData](#).

Action

Return an enumerator for the rows.

Syntax

```
GetEnumerator ( )
```

Item Method (ActiveData)

Class

[ActiveData](#).

Action

Returns an `ActiveDataRow` by index.

Syntax

```
Item(index)
```

Variable	Description
<i>index</i>	The index of the row to return. Integer.

RemoveRow Method (ActiveData)

Class

[ActiveData](#).

Action

Removes a row from the underlying `ActiveData` object.

Syntax

```
RemoveRow (rowNumber)
```

Variable	Description
<i>rowNumber</i>	The number of the row to remove (1-based). Integer.

RemoveColumn Method (ActiveData)

Class

[ActiveData](#).

Action

Removes a column from the underlying `ActiveData` object and returns a value that indicates success or failure.

Syntax

```
RemoveColumn (columnName)
```

Variable	Description
<i>columnName</i>	The number of the row to remove (1-based). Integer.

RenameColumn Method (ActiveData)

Class

[ActiveData](#).

Action

Renames a column in the `ActiveData` object and returns a value that indicates whether the column was renamed successfully.

Syntax

```
RenameColumn ( columnIndex, newColumnName )
```

Variable	Description
<i>columnIndex</i>	The index of the column to remove (1-based). Integer.
<i>newColumnName</i>	The new name for the column. String.

Reset Method (ActiveData)

Class

[ActiveData](#).

Action

Moves the focus to the first row of the `ActiveData` file.

Syntax

```
Reset ( )
```

Save Method (ActiveData)

Class

[ActiveData](#).

Action

Saves the `ActiveData` object.

Syntax

```
Save ( )
```

ColumnCount Property

Class

[ActiveData](#).

Action

Returns the number of columns in the underlying active data object.

Syntax

```
'Declaration  
Protected Read Property ColumnCount As Integer
```

Access

Read only.

Count Property

Class

[ActiveData](#).

Action

Returns the number of columns in an `ActiveData` row.

Syntax

```
'Declaration  
Protected Read Property Count As Integer
```

Access

Read only.

ActiveDataRow Class

Description

`ActiveDataRow` is the class that provides functionality for using rows in an `ActiveData` object. This class is an internal constructor.

Inheritance

`ActiveDataRow` does not derive from any class, and no classes derive from it.

Syntax

```
'Declaration  
Public Class ActiveDataRow
```

Properties

Name	Description
Count	The number of columns in an <code>ActiveData</code> row.
ExternalRowNumber	Gets the number of the row of the current object in the set of loaded rows.
RowNumber	Gets the number of the row of the current object in the <code>ActiveData</code> file.

Methods

Name	Description
Dispose	Cleans up the resources used by the row.
GetDouble	Gets the double value of a column.
GetLong	Gets the integer value of a column.
GetLongLong	Gets the long value of a column.
GetString	Gets the string of a column.
SetDouble	Sets the double value of a column.
SetLong	Sets the integer value of a column.
SetLongLong	Sets the long value of a column.
SetString	Sets the string value of a column.

Dispose Method (ActiveDataRow)

Class

[ActiveDataRow](#).

Action

Cleans up the resources used by the row.

Syntax

```
Dispose ( )
```

Notes

Caution: Do not use this method. Silk Test Workbench automatically calls this method when it is needed.

GetDouble Method (ActiveDataRow)

Class

[ActiveDataRow](#).

Action

Gets the double value of a column.

Syntax

```
GetDouble ( columnIndex )
```

or

```
GetDouble ( columnName )
```

Variable	Description
<i>columnIndex</i>	The index of the column (1-based). Integer.

Variable	Description
<i>columnName</i>	The name of the column. <i>String</i> .

GetLong Method (ActiveDataRow)

Class

[ActiveDataRow](#).

Action

Gets the integer value of a column.

Syntax

```
GetLong ( columnIndex )
```

or

```
GetLong ( columnName )
```

Variable	Description
<i>columnIndex</i>	The index of the column (1-based). <i>Integer</i> .
<i>columnName</i>	The name of the column. <i>String</i> .

GetLongLong Method (ActiveDataRow)

Class

[ActiveDataRow](#).

Action

Gets the long value of a column.

Syntax

```
GetLongLong ( columnIndex )
```

or

```
GetLongLong ( columnName )
```

Variable	Description
<i>columnIndex</i>	The index of the column (1-based). <i>Integer</i> .
<i>columnName</i>	The name of the column. <i>String</i> .

GetString Method (ActiveDataRow)

Class

[ActiveDataRow](#).

Action

Gets the string of a column.

Syntax

```
GetString (columnIndex)
```

or

```
GetString (columnName)
```

Variable	Description
<i>columnIndex</i>	The index of the column (1-based). Integer.
<i>columnName</i>	The name of the column. String.

SetDouble Method (ActiveDataRow)

Class

[ActiveDataRow](#).

Action

Sets the double value of a column.

Syntax

```
SetDouble (columnIndex, value)
```

or

```
SetDouble (columnName, value)
```

Variable	Description
<i>columnIndex</i>	The index of the column (1-based). Integer.
<i>columnName</i>	The name of the column. String.
<i>value</i>	The new value. Integer or Double.

SetLong Method (ActiveDataRow)

Class

[ActiveDataRow](#).

Action

Sets the integer value of a column.

Syntax

```
SetLong (columnIndex, value)
```

or

```
SetLong (columnName, value)
```

Variable	Description
<i>columnIndex</i>	The index of the column (1-based). Integer.
<i>columnName</i>	The name of the column. String.

Variable	Description
<i>value</i>	The new value. Integer.

SetLongLong Method (ActiveDataRow)

Class

[ActiveDataRow](#).

Action

Sets the long value of a column.

Syntax

```
SetLongLong (columnIndex, value)
```

or

```
SetLongLong (columnName, value)
```

Variable	Description
<i>columnIndex</i>	The index of the column (1-based). Integer.
<i>columnName</i>	The name of the column. String.
<i>value</i>	The new value. Long.

SetString Method (ActiveDataRow)

Class

[ActiveDataRow](#).

Action

Sets the string value of a column.

Syntax

```
SetString (columnIndex, value)
```

or

```
SetString (columnName, value )
```

Variable	Description
<i>columnIndex</i>	The index of the column (1-based). Integer.
<i>columnName</i>	The name of the column. String.
<i>value</i>	The new value. String.

Count Property

Class

[ActiveData](#).

Action

Returns the number of columns in an `ActiveData` row.

Syntax

```
'Declaration  
Protected Read Property Count As Integer
```

Access

Read only.

ExternalRowNumber Property

Class

[ActiveDataRow](#).

Action

Gets the row number the current object is in the set of loaded rows.

Syntax

```
'Declaration  
Protected Read Property ExternalRowNumber As Integer
```

Access

Read only.

RowNumber Property

Class

[ActiveDataRow](#).

Action

Gets the row number the current object is in the actual file.

Syntax

```
'Declaration  
Protected Read Property RowNumber As Integer
```

Access

Read only.

Agent Class

Description

`Agent` is the class for the Open Agent, the component of Silk Test Workbench that interacts with the graphical user interface.

`Agent` has a predefined identifier, `Agent`. To call a method of the `Agent`, use this syntax:

```
Agent.method()
```

Inheritance Hierarchy

Agent does not derive from any class, and no classes derive from it.

Syntax

```
'Declaration  
Public Class Agent
```

Properties

Name	Description
Desktop	Gets the root GUI object.
SystemFunctions	Gets the <code>SystemFunctions</code> object, which allows you to perform operating-system-specific operations, both on the local machine and on remote machines on which the Open Agent is installed.

Methods

Name	Description
Attach	Attaches to the given application. Enables you to specify an additional command-line pattern and tech domain.
Connect	Connects to an agent on the given machine by using the specified host and port.
Decrypt	Decrypts the given string. Only strings that were encrypted with the Encrypt method can be decrypted.
DetachAll	Detaches all currently attached applications.
Encrypt	Encrypts the given string.
ExecuteBaseState	Ensures that the test application is running and ready for testing.
GetOption	Retrieves the value of an agent option.
ResetOptions	Resets all agent options to their default values.
SetOption	Sets an agent option. This option is distributed to all technology domains.
Shutdown	Stops the agent. Should be called only when the test execution is finished.

Attach Method

Class

[Agent](#).

Action

Attaches to the given application. Enables you to specify an additional command-line pattern and tech domain.

Syntax

```
Attach (executablePattern, commandLinePattern, techDomains)
```

Variable	Description
<code>executablePattern</code>	The executable name of the application. The pattern may include the wildcards '?' and '*' which match one or none to many characters respectively. For example <code>myApplication.exe</code> , <code>myApplication.exe</code> , and <code>myApp*.exe</code> . <code>String</code> .
<code>commandLinePattern</code>	<i>Optional:</i> This pattern is matched against the command line arguments of the application. This is useful when multiple instances of an application are running, but only some of them should be tested. For Java applications, the command line pattern could include the name of a characteristic jar or the main class, for example <code>*org.MyMainClass</code> . You can use "" to specify no command line pattern when you want to load specific tech domains. <code>String</code> .
<code>techDomains</code>	<i>Optional:</i> The tech domains to load in the application. Typically, this parameter is only used by technical support. As a best practice, do not specify a tech domain. If you do not specify a tech domain, all available tech domains are loaded. <code>TechDomain</code> .

Examples

The following example attaches to the Notepad application.

```
Agent.Attach("notepad.exe")
```

The following example shows how to use the command-line pattern to attach to a specific instance of a process when multiple instances of the application are running.

```
Agent.Attach("javaw.exe", "*org.MyMainClass")
```

The following example shows how to attach to Internet Explorer and load the Win32 tech domain:

```
Agent.Attach("iexplore.exe", "", {"WIN32"})
```

Connect Method

Class

[Agent](#).

Action

Connects to an agent on the given machine by using the specified host and port.

If no agent is running or the agent cannot be reached on that machine, an exception is thrown.

If the specified host is the localhost, the agent is started.

After the connection to this agent is established for the first time, all agent options are reset to their default values by calling `Agent.ResetOptions()`.

Syntax

```
Connect (host, [port])
```

Variable	Description
<i>host</i>	The host of the Open Agent. <code>String</code> .
<i>port</i>	<p><i>Optional:</i> The port of the Open Agent. If a port is not specified, the default port is used. This port is the information service port with the default value of 22901. For example, to connect the agent to a different information service port, type</p> <pre>Agent.Connect("myRemoteMachine", portnumber)</pre> <p>If you are connected to a remote agent, you can connect to your local agent by typing</p> <pre>Agent.Connect("localhost").Integer.</pre>

Decrypt Method

Class

[Agent](#).

Action

Decrypts the given string. Only strings can be decrypted that were encrypted with the `Encrypt` method.

Syntax

```
Decrypt(toDecrypt)
```

Variable	Description
<i>toDecrypt</i>	The string to decrypt. <code>String</code> .

DetachAll Method

Class

[Agent](#).

Action

Detaches all currently attached applications.

Syntax

```
DetachAll( )
```

Encrypt Method

Class

[Agent](#).

Action

Encrypts the given string.

Syntax

```
Encrypt ( toEncrypt )
```

Variable	Description
<i>toEncrypt</i>	The string to encrypt. String.

ExecuteBaseState Method

Class

[Agent](#).

Action

Ensures that the test application is running and ready for testing.

Syntax

```
TestObject ExecuteBaseState( baseState )
```

Variable	Description
<i>baseState</i>	Contains all information required for executing the base state. IBaseState.

GetOption Method

Class

[Agent](#).

Action

Retrieves the value of an agent option.

Syntax

```
GetOption( name )
```

Variable	Description
<i>name</i>	The name of the option. A list of available options are defined in the Options class. String.

Example

For example, you might type:

```
desktop.getOption(Options.ObjectResolveTimeout)
```

ResetOptions Method

Class

[Agent](#).

Action

Resets all agent options to their default values.

Syntax

```
ResetOptions()
```

SetOption Method

Class

[Agent](#).

Action

Sets an agent option. This option is distributed to all Tech Domains.

Syntax

```
SetOption(name, value)
```

Variable	Description
<i>name</i>	The name of the option. A list of available options are defined in the <code>Options</code> class. <code>String</code> .
<i>value</i>	The value of the option. <code>Object</code> .

Example

For example, you might type:

```
Agent.setOption(Options.ObjectResolveTimeout, true)
```

Shutdown Method (Agent)

Class

[Agent](#).

Action

Call this method to ensure that the Open Agent stops after a test run, for example after a nightly test execution. You should only call this method at the end of a test execution, and not before all actions of the test are executed. If any actions would follow the `Shutdown`, the agent would be restarted. Alternatively, the following code sample shows how you can stop the Open Agent from the command line:

```
openAgent.exe -shutDown
```

Syntax

VB

```
Shutdown()
```

Example: Using the shutdown method

```
// VB code  
<AssemblyCleanup(>  
Public Shared Sub ShutdownAgentAfterTestRun()
```

```
Agent.Shutdown()  
End Sub
```

Desktop Property

Class

[Agent](#).

Action

Gets the root GUI object.

Syntax

```
'Declaration  
Protected Read Property Desktop As Desktop
```

Access

Read only.

SystemFunctions Property (Agent)

Class

[Agent](#).

Action

Gets the `SystemFunctions` object, which allows you to perform operating-system-specific operations, both on the local machine and on remote machines on which the Open Agent is installed. For information on the available system functions, see the topic *SystemFunctions Class*.

Syntax

```
'Declaration  
Public Read Property SystemFunctions As SystemFunctions
```

Access

Read only.

Example

For example, to start Notepad on the remote machine, you could add the following code into the script:

```
Agent.SystemFunctions.Execute("notepad.exe")
```

BaseState Class

Description

The `BaseState` class ensures that the application under test is running and ready for testing. Additionally the class is used to bring the application to the front.

If you try to attach the agent to the application and the test object, which is specified by the `BaseState.Locator`, is found, the base state brings the window containing the test object to the front

and returns the found test object immediately. If the test object is not found the application is started with the command line as specified in `baseStateInfo` and the agent attaches to the application. The agent waits until the test object is found. You can specify the timeout for the wait with the option `Options.ObjectResolveTimeout`. The default value for the timeout is 30 seconds. To change the timeout see `Desktop.SetOption(String, Object)`. You can also change the timeout in the UI by editing the **Application ready timeout** under **Playback > Timing** in the **Options** dialog box. If the test object is found within the given timeout the window that contains the test object is brought to the front and the found test object is returned. If no test object is found after the timeout an exception is thrown.

Inheritance Hierarchy

`BaseState` does not derive from any class, and no classes derive from it.

Syntax

```
'Declaration
Public Class BaseState _
Implements IBaseState
```

Properties

Name	Description
CommandLineArguments	Gets or sets the command-line arguments.
CommandLinePattern	Gets or sets the command-line pattern.
ExecutablePattern	Gets or sets the executable pattern.
Executable	Gets the name of the executable.
Locator	Returns the locator of the executable.
TechDomains	Gets or sets the list of tech domains to be used for testing.
WorkingDirectory	Gets or sets the working directory.

CommandLineArguments Property

Class

[BaseState](#).

Action

Gets or sets the command-line arguments.

Syntax

```
'Declaration
Public ReadWrite Property CommandLineArguments As String
```

Access

Read and write.

CommandLinePattern Property

Class

[BaseState](#).

Action

Gets or sets the command-line pattern.

Syntax

```
'Declaration  
Public ReadWrite Property CommandLinePattern As String
```

Access

Read and write.

ExecutablePattern Property

Class

[BaseState](#).

Action

Gets or sets the executable pattern.

Syntax

```
'Declaration  
Public ReadWrite property ExecutablePattern As String
```

Access

Read and write.

Executable Property

Class

[BaseState](#).

Action

Returns the name of the executable.

Syntax

```
'Declaration  
Public Read Property CommandLineArguments As String
```

Access

Read only.

Locator Property

Class

[BaseState](#).

Action

Gets the locator of the executable.

Syntax

```
'Declaration  
Public Read Property Locator As String
```

Access

Read only.

TechDomains Property

Class

[BaseState](#).

Action

Gets the technology domains that are necessary for an executable.

Syntax

```
'Declaration  
Public Read Property TechDomains As List of TechDomain
```

Access

Read only.

WorkingDirectory Property

Class

[BaseState](#).

Action

Gets or sets the working directory. Can contain Windows environment variables.

Syntax

```
'Declaration  
Public ReadWrite Property WorkingDirectory As String
```

Access

Read and write.

BrowserBaseState Class

Description

Ensures that the browser that is specified by the `Executable` property is running and ready for testing. The base state additionally navigates to the URL that is specified by the `Url` property and brings the browser to the front. The browser base state is executed as follows:

- Try to attach the agent to the browser.
 - If the test object, which is specified by the `Locator` property, is found, the base state navigates to the given URL, brings the browser to the front, and returns the found test object.

- If the test object is not found the browser is started with the command line as specified in `browserBaseStateInfo` and the agent attaches to the browser.
- The agent waits until the test object is found. The timeout can be specified with the option `Options.ObjectResolveTimeout`. To change the timeout see the `SetOption` method of the `Desktop` class.
 - If the test object is found within the given timeout the base state navigates to the given URL, brings the browser to the front and returns the found test object.
 - If no test object is found after the timeout an Exception is thrown.

Inheritance Hierarchy

`BrowserBaseState` does not derive from any class, and no classes derive from it.

Syntax

```
'Declaration
Public Class BrowserBaseState _
Implements IBaseState
```

Properties

Name	Description
<i>CommandLineArguments</i>	Gets or sets the command-line arguments. (Inherited from <i>BaseState</i>)
<i>CommandLinePattern</i>	Gets or sets the command-line pattern. (Inherited from <i>BaseState</i>)
<i>ExecutablePattern</i>	Gets or sets the executable pattern. (Inherited from <i>BaseState</i>)
<i>Executable</i>	Gets the name of the executable. (Inherited from <i>BaseState</i>)
<i>Locator</i>	Returns the locator of the executable. (Inherited from <i>BaseState</i>)
<i>TechDomains</i>	Gets or sets the list of tech domains to be used for testing. (Inherited from <i>BaseState</i>)
<i>Url</i>	Gets the Url to navigate to.
<i>WorkingDirectory</i>	Gets or sets the working directory. (Inherited from <i>BaseState</i>)

Url Property

Class

[*BrowserBaseState*](#).

Action

Gets the URL to navigate to.

Syntax

```
'Declaration
Public Read Property Url As String
```

Access

Read only.

ConsoleWindow Class

Description

ConsoleWindow is the class for consoles.

Inheritance Hierarchy

ConsoleWindow does not derive from any class, and no classes derive from it.

Syntax

```
'Declaration  
Public Class ConsoleWindow
```

Methods

Name	Description
Close	Closes the console.
CloseAll	Closes all open consoles or all consoles with a specific caption.
GetContents	Returns the contents of the console.
Open	Opens a new console.
TypeKeys	Sends a set of keystrokes to the console.

Close Method (ConsoleWindow)

Class

[ConsoleWindow](#).

Action

Closes the console.

Syntax

```
consoleWindow.Close ([sItemIdentifier])
```

Variable	Description
<i>sItemIdentifier</i>	The index of the console window or the caption of the window. If this parameter is left blank, Silk Test Workbench closes the first found console window. STRING.

Example 1

The following sample shows how you can use the index to define that you want to close the second console window:

```
consoleWindow.Close(2)
```

Example 2

The following sample shows how you can use the full identifier of a console window to close the console window:

```
consoleWindow.Close("C:\\Windows\\system32\\cmd.exe[1]")
```

CloseAll Method (ConsoleWindow)

Class

[ConsoleWindow](#).

Action

Closes all open consoles or all consoles with a specific caption.

Syntax

VB

```
consoleWindow.CloseAll ([sCaption])
```

Variable	Description
<i>sCaption</i>	Set this parameter to close only the consoles with this caption. STRING

Example

The following sample shows how you close all console windows with the caption MyCommandWindow:

```
// VB  
consoleWindow.CloseAll("MyCommandWindow")
```

GetContents Method (ConsoleWindow)

Class

[ConsoleWindow](#).

Action

Returns the contents of the console.

Syntax

```
lsContents = consoleWindow.GetContents ([sItemIdentifier])
```

Variable	Description
<i>lsContents</i>	The console contents. LIST OF STRING.
<i>sItemIdentifier</i>	The index of the console window or the caption of the window. If this parameter is left blank, Silk Test Workbench returns the contents of the first found console window. STRING.

Notes

- Each string in the returned list of strings corresponds to one row in the console.

Example 1

The following sample shows how you can use the index to define that you want to get the contents of the second console window:

```
lsContents = consoleWindow.GetContents(2)
```

Example 2

The following sample shows how you can use the full identifier of a console window to get the contents of the console window:

```
lsContents = consoleWindow.GetContents("C:\\Windows\\system32\\cmd.exe[1]")
```

Open Method (ConsoleWindow)

Class

ConsoleWindow.

Action

Opens a new console.

Availability

This functionality is supported only if you are using the Open Agent.

Syntax

VB

```
ConsoleWindow.Open ([caption])
```

Variable	Description
<i>caption</i>	The caption for the new console window. String.

Example

The following sample shows how you can open a new console with the caption "My Console":

```
// VB  
ConsoleWindow.Open("My Console")
```

TypeKeys Method (ConsoleWindow)

Class

[ConsoleWindow](#).

Action

Sends a set of keystrokes to the console.

Syntax

```
ConsoleWindow.TypeKeys (sEvents [, nDelay, ensureFocus, sItemIdentifier])
```

Variable	Description
<i>sEvents</i>	The keystrokes to type. STRING.
<i>nDelay</i>	<i>Optional:</i> The delay between keystrokes (in seconds and fractions of seconds). NUMBER.
<i>ensureFocus</i>	<i>Optional:</i> Whether the agent brings the application to the foreground and then sets the keyboard focus to the control on which the method is executed. This is executed before the first key is typed, which means it is not rechecked for each keystroke when you specify multiple keys to be typed. By default, this variable is set to TRUE. BOOLEAN.
<i>sItemIdentifier</i>	The index of the console window or the caption of the window. If this parameter is left blank, Silk Test Workbench sends the keystrokes to the first found console window. STRING.

Notes

- If no console is open, `TypeKeys` opens a console.
- On Windows, `TypeKeys` first gives the console input focus before typing into it.
- If you specify *nDelay*, that value overrides the value set with the `OPT_KEYBOARD_DELAY` option, which you set with `SetOption`.
- If keystrokes are not recognized, you can try to use a higher value for the delay.
- A key can be followed by a counter, which defines how often the keys should be typed. The counter can be combined with the delay.
- During the delay time, the screen is locked and interaction with the mouse and keyboard is no longer possible.
- When recording with the DOM extension `TypeKeys` ("`<Tab>`") will not be captured. Since the script refers to object to type in directly, it is not necessary to record this manual Tab. You can manually enter a `TypeKeys` ("`<Tab>`") into your script if you want to; it just will not be recorded.
- When specifying groups of keys, such as **Ctrl-Shift**, the agent supports plus and minus signs.

Example

The following code sample executes the `dir` command in the console window to list the files and folders in the directory:

```
// VB  
ConsoleWindow.TypeKeys ("dir<Enter>")
```

DllCall Class

Description

The `DllCall` class allows NTF users to call exposed DLL functions of any DLL either on the Agent or in the AUT.

Inheritance Hierarchy

DllCall does not derive from any class, and no classes derive from it.

Syntax

```
'Declaration  
Public Class Agent
```

Methods

Name	Description
UnloadAllDllsFromAgent	Unloads all DLLs from the agent.
UnloadDllFromAgent	Unloads the specified DLL from the agent.

UnloadAllDllsFromAgent Method

Class

[DllCall](#).

Action

Unloads all DLLs from the agent.

Syntax

```
Agent.UnloadAllDllsFromAgent ( )
```

UnloadDllFromAgent Method

Class

[DllCall](#).

Action

Unloads the specified DLL from the Agent.

Syntax

```
bSuccessful = Agent.UnloadDll (sDllName)
```

Variable	Description
<i>bSuccessful</i>	True if the DLL was successfully unloaded, false if not. BOOLEAN.
<i>sDllName</i>	The name of the DLL file. STRING.

Notes

You can use `UnloadDllFromAgent` only to unload normal DLLs, not mixed assemblies. To unload mixed assemblies, use `UnloadAllDllsFromAgent`.

IBaseState Interface

Description

Interface for base states. A base state makes an application ready for testing. It launches it if necessary, wait for a certain locator to be found and brings the application to the front.

Syntax

```
'Declaration  
Public Interface IBaseState
```

Methods

Name	Description
Execute	Executes the base state on the machine as specified by the desktop.

Execute Method

Class

[BaseState](#).

Action

Executes the base state on the machine as specified by the desktop.

Syntax

```
TestObject = BaseState.Execute()
```

Variable	Description
TestObject	The object for which the locator should wait.

Example: Specify the browser and the URL of a web application in the base state

You can use the following code to specify Internet Explorer as the browser on which a web application should be tested and *www.borland.com* as the URL of the web application:

```
Dim baseState = New  
BrowserBaseState(BrowserType.InternetExplorer,  
"www.borland.com")  
baseState.Execute()
```

To additionally store the base state in a variable:

```
Dim baseState = New  
BrowserBaseState(BrowserType.InternetExplorer,  
"www.borland.com")  
Dim browserApplication As BrowserApplication =  
baseState.Execute()
```

To specify a mobile browser on a mobile device, for example Safari on an iOS device, you can use the following code:

```
Dim baseState = New BrowserBaseState(BrowserType.Safari,  
"www.borland.com")
```

```
baseState.MobileDeviceName = "My iPhone"
baseState.Execute()
```

Example: Specify the path to the executable and a locator for the main window of the AUT

You can use the following code to specify `C:/windows/system32/notepad.exe` as the path to the executable of the AUT and `//Window[@caption='*Notepad*']` as the locator for the main window of the AUT:

```
Dim baseState = New BaseState("C:/windows/system32/
notepad.exe", "//Window[@caption='*Notepad*']")
baseState.Execute()
```

To additionally store the base state in a variable:

```
Dim baseState = New BaseState("C:/windows/system32/
notepad.exe", "//Window[@caption='*Notepad*']")
Dim mainWindow As Window = baseState.Execute()
```

Timer Class

Description

The `Timer` class enables you to accurately measure elapsed time.

Among other usages, the methods and properties in the `Timer` class are used for the timing of test executions that are triggered from Silk Performer. For additional information on integrating Silk Test Workbench with Silk Performer, refer to the [Silk Performer Help](#).

Inheritance Hierarchy

`BaseState` does not derive from any class, and no classes derive from it.

Syntax

```
'Declaration
Public Class Timer
```

Methods

Name	Description
Pause	Pauses the time measurement.
Resume	Resumes the time measurement.
Start	Starts or resumes the time measurement.
StartNew	Initializes a new <code>Timer</code> instance, sets the elapsed time to zero, and starts measuring elapsed time.
Stop	Stops the time measurement.

Properties

Name	Description
Elapsed	Gets the elapsed time span of the timer.

Name	Description
ElapsedMilliseconds	Gets the elapsed time span of the timer in milliseconds.
IsRunning	Gets whether the timer is currently running or not.
Name	Gets or sets the name of the timer which is used for interfacing with Silk Performer.

Pause Method (Timer)

Class

[Timer](#).

Action

Pauses the time measurement.

Syntax

```
timer.Pause ()
```

Resume Method (Timer)

Class

[Timer](#).

Action

Resumes the time measurement.

Syntax

```
timer.Resume ()
```

Start Method (Timer)

Class

[Timer](#).

Action

If the timer is currently stopped, starts the time measurement. If the timer is currently paused, resumes the time measurement.

Syntax

```
timer.Start ()
```

StartNew Method (Timer)

Class

[Timer](#).

Action

Initializes a new `Timer` instance, sets the elapsed time to zero, and starts measuring elapsed time. The name is provided for interfacing with Silk Performer.

Syntax

```
timer=StartNew ([timerName])
```

Variable	Description
<code>timer</code>	The new <code>Timer</code> instance that has just begun measuring elapsed time. <code>Timer</code> .
<code>timerName</code>	<i>Optional:</i> The name of the new timer. The name is provided for interfacing with Silk Performer. <code>String</code> .

Stop Method (Timer)

Class

[Timer](#).

Action

Stops the time measurement.

Syntax

```
timer.Stop()
```

Elapsed Property (Timer)

Class

[Timer](#).

Action

Gets the elapsed time of the timer.

Syntax

```
'Declaration  
Public Read Property Elapsed As TimeSpan
```

Access

Read.

ElapsedMilliseconds Property (Timer)

Class

[Timer](#).

Action

Gets the elapsed time of the timer in milliseconds.

Syntax

```
'Declaration  
Public Read Property ElapsedMilliseconds As Long
```

Access

Read.

IsRunning Property (Timer)

Class

[Timer](#).

Action

Gets whether the timer is currently running or not. Returns true if the timer is running.

Syntax

```
'Declaration  
Public Read Property IsRunning As Boolean
```

Access

Read.

Name Property (Timer)

Class

[Timer](#).

Action

Gets or sets the name of the timer which is used for interfacing with Silk Performer.

Syntax

```
'Declaration  
Public ReadWrite Property Name As String
```

Access

Read and write.

Workbench Class

Description

`Workbench` is the class that provides functionality for adding verifications and running child scripts.

Inheritance hierarchy

`Workbench` does not derive from any class, and no classes derive from it.

Syntax

```
'Declaration  
Public Class Workbench
```

To call a method of the Workbench, use this syntax:

```
Workbench.method()
```

Properties

Name	Description
Username	Returns the name of the current Silk Test Workbench user.

Methods

Name	Description
LoadActiveData	Load an <code>ActiveData</code> object to use it in a script.
ResultComment Method	Adds a comment as a step to the Details tab of the Result window.
RunScript	Runs a child script, which is identified by its name, and passes the parameters of the child script.
Verify	Verifies that the expected value equals the actual value and enables you to add a comment.
VerifyAsset	Executes a verification asset.

LoadActiveData Method

Class

[Workbench](#).

Action

Load an `ActiveData` asset for use by a script.

Syntax

```
Workbench.LoadActiveData("activeDataName", [sheetName, startRow, endRow,  
randomCount, readOnly])
```

Variable	Description
<code>activeDataName</code>	The name of the <code>ActiveData</code> asset that you want the script to use. <code>STRING</code> .  Note: If your environment uses multiple projects, use a project qualifier to insert an <code>ActiveData</code> asset, which is not uniquely named, from the Common project. For details, see the example.
<code>sheetName</code>	<i>Optional:</i> The name of the sheet that is used. The sheet specified here overrides the sheet that is specified in the <code>ActiveData</code> asset. By default, the sheet that is specified in the asset is used. <code>STRING</code>
<code>startRow</code>	<i>Optional:</i> The index of the row in the <code>ActiveData</code> asset to load first. <code>INTEGER</code> .

Variable	Description
<i>endRow</i>	<i>Optional:</i> The index of the row in the <code>ActiveData</code> asset to load last. INTEGER.
<i>randomCount</i>	<i>Optional:</i> Determines if and how records from the <code>ActiveData</code> file associated with the asset are used in the <code>ActiveData</code> test. A value of 0 or <code>False</code> turns off random mode. The value of -1 or <code>True</code> uses all rows from the <code>StartRow</code> value through <code>EndRow</code> value in a random order in the <code>ActiveData</code> test. A value of 1 through N, where N is the number of rows in the <code>Test Data</code> asset, uses that number of random rows from the range from <code>StartRow</code> to <code>EndRow</code> . For additional information about using different <code>StartRow</code> and <code>EndRow</code> values with the acceptable values for the <code>RandomCount</code> parameter, see <i>Determining Data Use for ActiveData</i> . INTEGER.
<i>readOnly</i>	<i>Optional:</i> Determines whether to open the <code>ActiveData</code> asset as read/write or read only. Set to <code>False</code> to open the <code>ActiveData</code> asset with read/write permission. Set to <code>True</code> to open the <code>ActiveData</code> asset as read-only. If set to read-only, any operation that attempts to write to the <code>ActiveData</code> asset in the <code>ActiveData</code> testing portion of a script generates a run-time error. <code>ActiveData</code> asset are opened for read/write permission by default. BOOLEAN.

Examples

To include random rows from an `ActiveData` in a script, you might type:

```
Public Sub Main()
    AddRandomToPhoneBook( 3 )      'Reads 3 rows in a random order
End Sub

Public Sub AddRandomToPhoneBook( howMany As Integer )
    Dim data As ActiveData = Workbench.LoadActiveData( "PhoneBookData", 1, -1,
howMany )
    Dim row As ActiveDataRow

    With _desktop.BrowserWindow( "/BrowserApplication//BrowserWindow" )
        For Each row In data
            Dim FirstName As String = row.GetString( "fname" )
            Dim LastName As String = row.GetString( "lname" )
            Dim PhoneNumber As String = row.GetString( "number" )

            .DomTextField( "@id='txtFirstName'" ).SetText( FirstName )
            .DomTextField( "@id='txtLastName'" ).SetText( LastName )
            .DomTextField( "@id='txtPhoneNumber'" ).SetText( PhoneNumber )

            .DomButton( "@id='btnAdd'" ).Select()
        Next
    End With
End Sub
```

To include a portion of data from an `ActiveData` file in a script, you might type:

```
Public Sub Main()
    AddSomeToPhoneBook( 3, 5 )      'Reads rows 3, 4 and 5 only
End Sub

Public Sub AddSomeToPhoneBook( firstToAdd As Integer, lastToAdd As Integer )
    Dim data As ActiveData = Workbench.LoadActiveData( "PhoneBookData",
firstToAdd, lastToAdd )
    Dim row As ActiveDataRow
```

```

With _desktop.BrowserWindow("/BrowserApplication//BrowserWindow")
  For Each row In data
    Dim FirstName As String = row.GetString("fname")
    Dim LastName As String = row.GetString("lname")
    Dim PhoneNumber As String = row.GetString("number")

    .DomTextField("@id='txtFirstName']").SetText(FirstName)
    .DomTextField("@id='txtLastName']").SetText(LastName)
    .DomTextField("@id='txtPhoneNumber']").SetText(PhoneNumber)

    .DomButton("@id='btnAdd']").Select()
  Next
End With
End Sub

```

To include all data as read only from an `ActiveData` file in a script, you might type:

```

Public Sub Main()
  AddAllToPhoneBookReadOnly() 'Opens the data file as read only
End Sub

Public Sub AddAllToPhoneBookReadOnly()
  Dim data As ActiveData = Workbench.LoadActiveData("PhoneBookData", 1, -1, 0, True)
  Dim row As ActiveDataRow

  With _desktop.BrowserWindow("/BrowserApplication//BrowserWindow")
    For Each row In data
      Dim FirstName As String = row.GetString("fname")
      Dim LastName As String = row.GetString("lname")
      Dim PhoneNumber As String = row.GetString("number")

      .DomTextField("@id='txtFirstName']").SetText(FirstName)
      .DomTextField("@id='txtLastName']").SetText(LastName)
      .DomTextField("@id='txtPhoneNumber']").SetText(PhoneNumber)

      .DomButton("@id='btnAdd']").Select()
    Next
  End With
End Sub

```

If your environment uses multiple projects, use a project qualifier to insert an `ActiveData` file, which is not uniquely named, from the Common project. For example, you might type:

```

Public Sub Main()
  AddAllToPhoneBookReadOnly() 'Opens the data file as read only
End Sub

Public Sub AddAllToPhoneBookReadOnly()
  Dim data As ActiveData = Workbench.LoadActiveData("Common.PhoneBookData", 1, -1, 0, True)
  Dim row As ActiveDataRow

  With _desktop.BrowserWindow("/BrowserApplication//BrowserWindow")
    For Each row In data
      Dim FirstName As String = row.GetString("fname")
      Dim LastName As String = row.GetString("lname")
      Dim PhoneNumber As String = row.GetString("number")

      .DomTextField("@id='txtFirstName']").SetText(FirstName)
      .DomTextField("@id='txtLastName']").SetText(LastName)
      .DomTextField("@id='txtPhoneNumber']").SetText(PhoneNumber)

      .DomButton("@id='btnAdd']").Select()
    Next
  End With
End Sub

```

```
End With
End Sub
```

 **Note:** Assets in any project can access assets in the Common project. However, the reverse is not true. To use an `ActiveData` file, from the project in which you are currently working, you do not need to specify a project qualifier. Specify the "Common" project qualifier to use an `ActiveData` file from the Common project in another project.

RunScript Method

Class

[Workbench](#).

Action

Runs a child script, which is identified by its name, and passes its parameters.

Syntax

```
Workbench.RunScript("scriptname", [parameters])
```

Variable	Description
<i>scriptname</i>	The name of the child script that you want to run. <code>STRING</code> .  Note: Assets in any project can access assets in the Common project. However, the reverse is not true. To use a script from the project in which you are currently working, you do not need to specify a project qualifier. Specify the "Common" project qualifier to use a script from the Common project in another project.
<i>parameters</i>	<i>Optional:</i> The parameters that you want to pass to the main script from the child script. <code>STRING</code> or <code>OBJECT</code> .

 **Note:** Scripts stored in Oracle databases are case sensitive. Any included script from an Oracle database must match the name in the database exactly or Silk Test Workbench fails to load the script.

Examples

If your environment uses multiple projects, use a project qualifier to run a script, which is not uniquely named, from the Common project. For example, you might type:

```
Workbench.RunScript("Common.AddAccount")
```

where `AddAccount` is a script that resides in the Common project as well as the project that you are currently using, and you want to use the script from the Common project rather than your current project.

Verify Method

Class

[Workbench](#).

Action

Verifies that the expected value equals the actual value and enables you to add a comment.

Syntax

This method has many variations:

```
result = Workbench.Verify(condition[, VerifyFlags])
```

or

```
result = Workbench.Verify(condition[, comment, VerifyFlags])
```

or

```
result = Workbench.Verify(expected, actual[, VerifyFlags])
```

or

```
result = Workbench.Verify(expected, actual[, VerifyFlags, comment])
```

Variable	Description
<i>result</i>	Whether the verification was successful. BOOLEAN.
<i>condition</i>	The condition that needs to be met. BOOLEAN.
<i>expected</i>	The value that you expect the script to return. OBJECT.
<i>actual</i>	The actual value that the script returns. OBJECT.
<i>comment</i>	<i>Optional:</i> The comment to include. STRING.
<i>VerifyFlags</i>	<i>Optional:</i> Whether a screenshot should be captured if the verification fails. This is an enumeration with the following possible values: <ul style="list-style-type: none">• None• ScreenShotOnFailure VerifyFlags.

Examples

To compare the expected value with the actual value and add a comment, type:

```
Workbench.Verify(expected As Object, actual As Object, comment As String)
```

For example, `Workbench.Verify("red", "green", "checking colors")` fails with the message `checking colors - Actual: [green]; Expected: [red]`.

To compare the expected value with the actual value, to add a comment, and to add a screenshot to the result file if the verification fails, type:

```
Workbench.Verify(expected As Object, actual As Object, comment As String, verifyFlags As VerifyFlags)
```

For example, `Workbench.Verify("red", "green", "checking colors", verifyFlags.ScreenShotOnFailure)` fails with the message `checking colors - Actual: [green]; Expected: [red]` and adds a screenshot to the result file.

To verify the value returned by the expected result and add a comment, type:

```
Workbench.Verify(condition As Boolean, comment As String)
```

For example, `Workbench.Verify(True, "Test Passed")` passes. While `Workbench.Verify(False, "Test Failed")` fails.

To verify the value returned by the expected result, to add a comment, and to add a screenshot to the result file if the verification fails, type:

```
Workbench.Verify(condition As Boolean, comment As String, verifyFlags As VerifyFlags)
```

For example, `Workbench.Verify(True, "Test Passed", verifyFlags.ScreenShotOnFailure)` passes and adds no screenshot. While `Workbench.Verify(False, "Test Failed", ScreenShotOnFailure)` fails and adds a screenshot to the result file.

To compare the actual value with the expected value for `IEnumerable` objects, such as lists and arrays, type:

```
Workbench.Verify(expectedEnumerable, actualEnumerable)
```

For example:

```
Dim selectedItemsList = listBox.SelectedItems ' we assume that a list with
the items "red" and "blue" is returned
Dim expectedItemsList = New List(Of String)()
expectedItemsList.Add("red")
expectedItemsList.Add("blue")

Workbench.Verify(selectedItemsList, expectedItemsList) ' verification passes

Dim expectedItemsArray = New String() { "red", "blue" }
Workbench.Verify(selectedItemsList, expectedItemsArray) ' verification passes
```

Note: Two `IEnumerable` objects are considered equal if both have the same number of elements, and the elements are equal and in the same order.

Note: Mathematical operations with floating point numbers may lead to two numbers that are not completely identical because of their internal representation, although they should be equal from a user point of view. Therefore, floating point numbers (`Double`, `Single`) are considered equal if their difference is less than 0.00001. At times, this value may not be correct for the situation. In this case, compare the two values with the `Verify(result As Boolean)` instead.

VerifyAsset Method (Workbench)

Class

[Workbench](#).

Action

Executes a verification asset. Throws an `ObjectNotFoundException` if the UI object to verify cannot be found.

Syntax

```
result = Verification.VerifyAsset(verificationAsset[, verifyFlags])
```

Variable	Description
<code>result</code>	Whether the verification was successful. <code>BOOLEAN</code> .
<code>verificationAsset</code>	The name of the verification asset to execute. <code>STRING</code> .
<code>VerifyFlags</code>	<p><i>Optional:</i> Whether a screenshot should be captured if the verification fails. This is an enumeration with the following possible values:</p> <ul style="list-style-type: none"> None ScreenShotOnFailure <p><code>VerifyFlags</code>.</p>

Examples

To execute a verification of the image asset *myImageAsset*, type:

```
Workbench.VerifyAsset("myImageAsset")
```

To execute a verification of the image asset *myImageAsset* and to add a screenshot to the result file if the verification fails, type:

```
Workbench.VerifyAsset("myImageAsset", verifyFlags.ScreenshotOnFailure)
```

ResultComment Method

Class

[Workbench](#).

Action

Adds a comment as a step to the **Details** tab of the **Result** window. Result comments allow you to add information about a test to the results of the test. After playback of the test, the comment appears as a step in the **Details** tab of the **Result** window.

Syntax

```
Workbench.ResultComment(comment)
```

Variable	Description
<i>comment</i>	The comment to add to the results. <code>STRING</code> .

Examples

If you want to point out in the results that the test did not perform a verification of the format of some inserted value, you could add a line like the following to your script:

```
Workbench.ResultComment("Note: This test did not verify that the format of the inserted value was correct.")
```

Username Property (Workbench)

Class

[Workbench](#).

Action

Returns the name of the current Silk Test Workbench user.

Syntax

```
'Declaration  
Protected Read Property Username As String
```

Access

Read only.

Data Types

This section lists the various types of data.

Note: For information on the .NET framework data types, for example `Integer`, `Boolean`, `String`, and so on, refer to the MSDN. For information about the data types that you can use in visual tests, see *Variables in Visual Tests*.

ClickType Enumeration

Description

Specifies how to click on a text during a replay of a `TextClick`.

Syntax

```
Public Enumeration ClickType
```

Members

Name	Description
Left	A single click with the left mouse button.
Right	A single click with the right mouse button.
Middle	A single click with the middle mouse button.
LeftDouble	A double click with the left mouse button.
Press	Clicking and holding the left mouse button.
Release	Releasing the left mouse button.

Color Class

Description

Describes a color in terms of red, green, blue, and alpha channels.

Inheritance Hierarchy

`Color` does not derive from any class, and no classes derive from it.

Syntax

```
Public Class Color
```

Fields

Name	Description
<code>BLACK</code>	Gets the color that has the ARGB value of #FF000000.
<code>WHITE</code>	Gets the color that has the ARGB value of #FFFFFFFF.
<code>GREEN</code>	Gets the color that has the ARGB value of #FF00FF00.
<code>RED</code>	Gets the color that has the ARGB value of #FFFF0000.
<code>BLUE</code>	Gets the color that has the ARGB value of #FF0000FF.
<code>YELLOW</code>	Gets the color that has the ARGB value of #FFFFFF00.
<code>MAGENTA</code>	Gets the color that has the ARGB value of #FFFF00FF.

Name	Description
CYAN	Gets the color that has the ARGB value of #FF00FFFF.

Properties

Name	Description
R	Gets the value of the red ARGB channel of the color. Integer
G	Gets the value of the green ARGB channel of the color. Integer
B	Gets the value of the blue ARGB channel of the color. Integer
A	Gets the value of the alpha ARGB channel of the color. Integer

ItemIdentifier Data Type

Description

Specifies an item in controls such as list boxes, tab controls, or combo boxes. Items can be identified by the following:

- Text (`String`).
- Index (`Integer`).
- A combination of text and index (`String`).

A string value specifies the name of the item. The string can contain wildcard characters. You can also specify the index of the item as a string, in the form "[n]", where n is the numerical index of the item.

Example

The following examples show how you can select an item in a `ListBox`:

```
listbox.select(0)    ' Selects the first item, which has the
index 0.
listbox.select("[0]") ' Also selects the first item.
listbox.select("apple") ' Selects the first item with text
"apple".
listbox.select("apple[1]") 'Selects the second item with the
text "apple".
```

ItemPath Data Type

Description

The hierarchical path from the root of the tree to a specific item. You have to always specify the entire hierarchy. Each part in the hierarchy of the item path can either be a name, an index, or a combination of both. You can uniquely identify each item in the hierarchical path by specifying one or more of its attributes.

Items in a tree have the following attributes:

- The hierarchical relationship between the item and other items.
- The title or the caption of the item.

- The 0-based ordinal number of the item in relation to its siblings.

Example

The following examples show how you can identify unique items within a tree by path, index, or a combination of both path and index:

Specification	Item
"/Desktop/ Applications/ Games"	A unique item "Games" under a unique item "Applications" under a unique item "Desktop" at the outer level of the tree.
"/Desktop/[2]/ [4]"	The fifth item under the third item under a unique item "Desktop" at the outer level of the tree.
"/Desktop/ Applications[2]/ Games"	A unique item "Games" under the third item with the text "Applications" under a unique item "Desktop" at the outer level of the tree.

ModifierKeys Enumeration

Description

Specifies the key modifiers that should be pressed during replay.

Syntax

```
Public Enumeration ModifierKeys
```

Members

Name	Description
None	No key modifiers.
Shift	The Shift modifier.
Alt	The Alt modifier.
Cmd	The Cmd modifier. Supported only for desktop browsers on macOS.
Control	The Ctrl modifier.
ControlAlt	The Ctrl+Alt modifiers.
ShiftControl	The Shift+Ctrl modifiers.
ShiftAlt	The Shift+Alt modifiers.
ShiftControlAlt	The Ctrl+Shift+Alt modifiers.

Example

To follow a link from a Microsoft Word document that you are currently editing, you have to press **Ctrl** and click on the link. You can do this as follows:

```
link.Click(MouseButton.Left, ClickPosition.Center,  
ModifierKeys.Control)
```

Note: All three parameters are required.

MouseButton Enumeration

Description

Defines values that specify the buttons on a mouse device.

Syntax

```
Public Enumeration MouseButton
```

Members

Name	Description
Left	The left mouse button. Left = 1.
Middle	The middle mouse button. Middle = 3.
Right	The right mouse button. Right = 2.

Point Class

Description

Specifies a point on the screen.

Inheritance Hierarchy

`Point` does not derive from any class, and no classes derive from it.

Syntax

```
Public Class Point
```

Properties

Name	Description
X	Gets the x coordinate.
Y	Gets the y coordinate.

Range Class

Description

Specifies a range with a minimum and a maximum.

Inheritance Hierarchy

`Range` does not derive from any class, and no classes derive from it.

Syntax

```
Public Class Range
```

Properties

Name	Description
<i>Minimum</i>	Gets the minimum.
<i>Maximum</i>	Gets the maximum.

Rectangle Class

Description

Specifies a rectangle on the screen.

Inheritance Hierarchy

Rectangle does not derive from any class, and no classes derive from it.

Syntax

```
Public Class Rectangle
```

Properties

Name	Description
<i>X</i>	Gets the x coordinate of the rectangle.
<i>Y</i>	Gets the y coordinate of the rectangle.
<i>Width</i>	Gets the width of the rectangle.
<i>Height</i>	Gets the height of the rectangle.
<i>Center</i>	Gets the center of the rectangle.
<i>IsEmpty</i>	Determines whether the rectangle is empty.

Methods

Name	Description
<i>Contains(Rectangle)</i>	Determines whether the current Rectangle contains the specified Rectangle. Boolean
<i>Contains(Point)</i>	Determines whether the current Rectangle contains the specified Point. Boolean
<i>Contains(X,Y)</i>	Determines whether the current Rectangle contains the specified coordinates. Boolean

TextPosition Class

Description

Specifies a position within a text field.

Inheritance Hierarchy

TextPosition does not derive from any class, and no classes derive from it.

Syntax

```
Public Class TextPosition
```

Properties

Name	Description
<i>Line</i>	Gets the line.
<i>Column</i>	Gets the column.

TextRange Class

Description

Specifies a range within a text field.

Inheritance Hierarchy

TextRange does not derive from any class, and no classes derive from it.

Syntax

```
Public Class TextRange
```

Properties

Name	Description
<i>StartLine</i>	Gets the start line of the range.
<i>StartColumn</i>	Gets the start column of the range.
<i>EndLine</i>	Gets the end line of the range.
<i>EndColumn</i>	Gets the end column of the range.

TreeContent Class

Description

Represents the content of a tree control. Every item in a tree is represented as a `TreeNode`.

Inheritance Hierarchy

TreeContent does not derive from any class, and no classes derive from it.

Syntax

```
Public Class TreeContent
```

Properties

Name	Description
<i>RootNodes</i>	Gets the root nodes of the corresponding tree.

TreeNode Class

Description

Represents a node in the `TreeContent`.

Inheritance Hierarchy

`TreeNode` does not derive from any class, and no classes derive from it.

Syntax

```
Public Class TreeNode
```

Properties

Name	Description
<code>Children</code>	Gets the child nodes of the <code>TreeNode</code> .
<code>Text</code>	Gets the text of the <code>TreeNode</code> .

Flex Class Reference

Lists the available classes for testing Flex controls. You can also customize Silk Test to test custom controls.

For additional information about the classes, see the *Apache Flex Developer's Guide*.

Note: Any known problems with Flex and Flex classes can be reproduced in Silk Test. For instance, dragging and dropping an element that uses the `FlexChart` class may not work if a chart element is clicked near its edges before you start dragging the element. This results in a failed replay because the drag start coordinates can be incorrect. This is a known issue with dragging and dropping in Flex. For details about known issues with Flex, see the *Apache Flex Release Notes*.

Note: The `FlexTitleWindow` class is recorded and recognized by Silk Test as a `FlexPanel` (although it is defined as a separate class). This is a known issue in Flex. For details about known issues with Flex, see the *Apache Flex Release Notes*.

FlexAccordion Class

Description

An Accordion navigator container has a collection of child containers, but only one of them at a time is visible. It creates and manages navigator buttons (accordion headers), which you use to navigate between the children.

There is one navigator button associated with each child container, and each navigator button belongs to the Accordion container, not to the child. When the user clicks a navigator button, the associated child container is displayed. The transition to the new child uses an animation to make it clear to the user that one child is disappearing and a different one is appearing.

The Accordion container does not extend the `ViewStack` container, but it implements all the properties, methods, styles, and events of the `ViewStack` container, such as `selectedIndex` and `selectedChild`.

Inheritance Hierarchy

- *FlexContainer*
 - FlexAccordion

Syntax

```
'Declaration  
Public Class FlexAccordion _  
Inherits FlexContainer
```

Properties

Name	Description
<i>alpha</i>	the alpha transparency value of the object specified. (Inherited from <i>FlexDisplayObject</i>)
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i>)
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>backgroundAlpha</i>	the alpha level of the color defined by the <i>backgroundColor</i> property, of the image or SWF file defined by the <i>backgroundImage</i> style. Valid values range from 0.0 to 1.0. (Inherited from <i>FlexContainer</i>)
<i>backgroundColor</i>	the background color of a component. (Inherited from <i>FlexContainer</i>)
<i>backgroundDisabledColor</i>	the background color of the component when it is disabled. The global default value is undefined. (Inherited from <i>FlexContainer</i>)
<i>backgroundImage</i>	the background image of a component. This can be an absolute or relative URL or class. (Inherited from <i>FlexContainer</i>)
<i>backgroundSize</i>	the percentage to change the image size to for the specified <i>backgroundImage</i> . (Inherited from <i>FlexContainer</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>FlexContainer</i>)
<i>creationIndex</i>	the order to instantiate and draw the children of the container. (Inherited from <i>FlexContainer</i>)
<i>creationPolicy</i>	the child creation policy for this Container. (Inherited from <i>FlexContainer</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)

Name	Description
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>fillAlphas</i>	the alpha transparency values used for the background fill of components. (Inherited from <i>FlexContainer</i>)
<i>fillColors</i>	the colors used to tint the background fill of the component. (Inherited from <i>FlexContainer</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexContainer</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use. (Inherited from <i>FlexContainer</i>)
<i>fontSize</i>	the height of the text, in pixels. (Inherited from <i>FlexContainer</i>)
<i>fontStyle</i>	whether the text is italic font. (Inherited from <i>FlexContainer</i>)
<i>fontWeight</i>	whether the text is boldface. (Inherited from <i>FlexContainer</i>)
<i>headerHeight</i>	the height of each accordion header, in pixels.
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>horizontalGap</i>	the number of pixels between children in the horizontal direction. The default value is 8.
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>label</i>	the text displayed by some navigator containers to represent this Container. (Inherited from <i>FlexContainer</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexContainer</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numChildren</i>	the number of child components in this container. (Inherited from <i>FlexContainer</i>)
<i>numColumns</i>	the total number of columns of data available. (Inherited from <i>FlexContainer</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>FlexContainer</i>)
<i>paddingBottom</i>	the number of pixels between the container's bottom border and its content area.

Name	Description
<i>paddingTop</i>	the number of pixels between the container's top border and its content area.
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectedChild</i>	a reference to the currently visible child container.
<i>selectedIndex</i>	the zero-based index of the currently visible child container.
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>textSelectedColor</i>	the color of selected text. The default value is 0x2B333C.
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>verticalGap</i>	the number of pixels between children in the vertical direction.
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Change	Dispatched when the selected child container changes.
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from FlexContainer)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from FlexContainer)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from FlexContainer)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. The return value is an array of rows, each of which is an array of items. (Inherited from FlexContainer)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from FlexContainer)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Scroll	Dispatched when the user manually scrolls the container. (Inherited from FlexContainer)

Name	Description
<i>SetFocus</i>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <i>FlexObject</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>Tostring</i>	Returns a string representation of the control. (Inherited from <i>FlexDisplayObject</i>)
<i>Type</i>	Dispatched when the user presses a key.
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly

Name	Description
	pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexAdvancedDataGrid Class

Description

Expands on the functionality of the standard DataGrid control to add data visualization features to your Apache Flex application. These features provide greater control of data display, data aggregation, and data formatting.

The AdvancedDataGrid control is like a List control except that it can show more than one column of data, making it suited for showing objects with multiple properties.

Inheritance Hierarchy

- [FlexListBase](#)
 - FlexAdvancedDataGrid
 - [FlexOLAPDataGrid](#)

Syntax

```
'Declaration
Public Class FlexAdvancedDataGrid _
Inherits FlexListBase
```

Properties

Name	Description
allowDragSelection	whether drag-selection is enabled. Drag-Selection is the ability to select an item by dragging into it as opposed to normal selection where you can't have the mouse button down when you mouse over the item you want to select.
allowMultipleSelection	whether you can allow more than one item to be selected at the same time. (Inherited from FlexListBase)
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
alternatingItemColors	the colors to use for the backgrounds of the items in the list. (Inherited from FlexListBase)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)

Name	Description
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>backgroundDisabledColor</i>	the color of text in the component if it is disabled. The default value is 0xAAB3B3. (Inherited from <i>FlexListBase</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>columnCount</i>	the number of columns to be displayed in a <i>TileList</i> control or items in a <i>HorizontalList</i> control. (Inherited from <i>FlexListBase</i>)
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>FlexListBase</i>)
<i>columnWidth</i>	the width of the control's columns. (Inherited from <i>FlexListBase</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>dataTipField</i>	the name of the field in the data provider items to display as the data tip. (Inherited from <i>FlexListBase</i>)
<i>depthColors</i>	the array of colors used for the rows of each level of the navigation tree of the <i>AdvancedDataGrid</i> control, in descending order. The default value is undefined.
<i>disabledColor</i>	the color of text in the component if it is disabled.
<i>displayItemsExpanded</i>	whether the navigation tree is expanded to show all items.
<i>editable</i>	whether the user can edit items in the data provider.
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexListBase</i>)
<i>focusAlpha</i>	the alpha transparency value of the focus skin. The default value is 0.4. (Inherited from <i>FlexListBase</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>headerColors</i>	an array of two colors used to draw the header background gradient.
<i>headerHeight</i>	the height of the header cell of the column, in pixels.
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>horizontalGridLineColor</i>	the color of the horizontal grid lines.

Name	Description
<code>iconField</code>	the name of the field in the data provider object that determines what to display as the icon. (Inherited from <code>FlexListBase</code>)
<code>id</code>	the ID of the component. (Inherited from <code>FlexObject</code>)
<code>indentation</code>	the indentation for each node of the navigation tree, in pixels. The default value is 17.
<code>labelField</code>	the name of the field in the data provider items to display as the label. (Inherited from <code>FlexListBase</code>)
<code>lastVisibleRow</code>	the index of the last visible child. (Inherited from <code>FlexListBase</code>)
<code>lockedColumnCount</code>	the index of the first column in the control that scrolls. (Inherited from <code>FlexListBase</code>)
<code>lockedRowCount</code>	the index of the first row in the control that scrolls. (Inherited from <code>FlexListBase</code>)
<code>minColumnWidth</code>	the minimum width of the columns, in pixels.
<code>mouseEnabled</code>	whether this object receives mouse messages. The default value is true, which means that by default any <code>InteractiveObject</code> instance that is on the display list receives mouse events. If <code>mouseEnabled</code> is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the <code>mouseEnabled</code> behavior for all children of an object on the display list, use <code>flash.display.DisplayObjectContainer.mouseChildren</code> . (Inherited from <code>FlexDisplayObject</code>)
<code>numAutomationChildren</code>	the number of automation children this container has. (Inherited from <code>FlexObject</code>)
<code>numColumns</code>	the total number of columns in the data available. (Inherited from <code>FlexListBase</code>)
<code>numRows</code>	the total number of rows of data available. (Inherited from <code>FlexListBase</code>)
<code>openDuration</code>	the length of an open or close transition for the navigation tree, in milliseconds. The default value is 250.
<code>paddingBottom</code>	the number of pixels between the bottom of the row and the bottom of the renderer in the row.
<code>paddingLeft</code>	the number of pixels between the control's left border and the left edge of its content area. The default value is 2.
<code>paddingRight</code>	the number of pixels between the control's right border and the right edge of its content area. The default value is 0.
<code>paddingTop</code>	the number of pixels between the top of the row and the top of the renderer in the row.
<code>percentHeight</code>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <code>FlexObject</code>)
<code>percentWidth</code>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the <code>width</code> or <code>explicitWidth</code> properties resets this property to NaN. (Inherited from <code>FlexObject</code>)

Name	Description
<i>resizableColumns</i>	whether the user can change the size of the columns.
<i>rollOverColor</i>	the color of the background of a renderer when the user rolls over it. The default value is 0xEEFEE6. (Inherited from <i>FlexListBase</i>)
<i>rowCount</i>	the number of rows to be displayed. (Inherited from <i>FlexListBase</i>)
<i>rowHeight</i>	the height of the rows in pixels. (Inherited from <i>FlexListBase</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectable</i>	whether the list shows selected items as selected. (Inherited from <i>FlexListBase</i>)
<i>selectedCells</i>	an Array of cell locations as row and column indices.
<i>selectedIndex</i>	the index in the data provider of the selected item. (Inherited from <i>FlexListBase</i>)
<i>selectedIndices</i>	an array of indices in the data provider of the selected items. (Inherited from <i>FlexListBase</i>)
<i>selectedItem</i>	a reference to the selected item in the data provider. (Inherited from <i>FlexListBase</i>)
<i>selectedItems</i>	an array of references to the selected items in the data provider. (Inherited from <i>FlexListBase</i>)
<i>selectionColor</i>	the color of the background of a renderer when the user selects it. The default value is 0x7FCEFF. (Inherited from <i>FlexListBase</i>)
<i>selectionDisabledColor</i>	the color of the background of a renderer when the component is disabled. The default value is 0xDDDDDD. (Inherited from <i>FlexListBase</i>)
<i>selectionMode</i>	the selection mode of the control.
<i>showDataTips</i>	whether dataTips are displayed for text in the rows. (Inherited from <i>FlexListBase</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TextObject</i>)
<i>textRollOverColor</i>	the text color of the label as the user moves the mouse pointer over the button. The default value is 0x2B333C. (Inherited from <i>FlexListBase</i>)
<i>textSelectedColor</i>	the color of the text of a renderer when the user selects it. The default value is 0x2B333C. (Inherited from <i>FlexListBase</i>)

Name	Description
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is <i>Nothing</i> . (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <i>useHandCursor</i> is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>useRollOver</i>	whether items are highlighted as the mouse rolls over them. (Inherited from <i>FlexListBase</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>variableRowHeight</i>	whether the individual rows can have different height. (Inherited from <i>FlexListBase</i>)
<i>verticalAlign</i>	the vertical alignment of a renderer in a row. (Inherited from <i>FlexListBase</i>)
<i>verticalGridLineColor</i>	the color of the vertical grid lines. The default value is 0x666666.
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>wordWrap</i>	whether text in the row should be word wrapped. (Inherited from <i>FlexListBase</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>ChangeFocus</i>	Changes the current focus. (Inherited from <i>FlexObject</i>)
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i>)
<i>Close</i>	Closes or collapses a AdvancedDataGrid branch.

Name	Description
ColumnGroupedADGHeaderShift	Dispatched when the user releases the mouse button on a column header after having dragged the column to a new location resulting in shifting the column to a new index.
ColumnStretch	Dispatched when a user changes the width of a column, indicating that the amount of data displayed in that column may have changed.
Deselect	Defines the value of the type property of the event object for an event that is dispatched when a previously selected item is deselected. (Inherited from FlexListBase)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DoubleSelect	Defines the value of the type property of the ListEvent object for an itemDoubleClick event, which indicates that the user double-clicked the mouse over a visual item in the control. (Inherited from FlexListBase)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from FlexListBase)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from FlexListBase)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from FlexListBase)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetCellData	Returns data for a cell in the grid.
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetGroupedItemChildrenCount	Returns the number of children within the first item of a group.
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)

Name	Description
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetRowData	Returns data for the row of the item in the data provider.
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from FlexListBase)
HeaderClick	Dispatched when the user releases the mouse button on a column header to request the control to sort the grid contents based on the contents of the column.
HeaderShift	Dispatched when the user releases the mouse button on a column header after having dragged the column to a new location resulting in shifting the column to a new index.
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsGroupedItem	Returns a value that specifies whether the item is a member of a group.
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from FlexScrollBase)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)

Name	Description
MultiSelect	Defines the value of the type property of the event object for an event that is dispatched when an item is selected as part of an action that selects multiple items. (Inherited from FlexListBase)
Open	Opens or expands an AdvancedDataGrid branch.
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Scroll	Defines the value of the type property of the event object for a scroll event. (Inherited from FlexListBase)
ScrollToIndex	Ensures that the data provider item at the given index is visible. (Inherited from FlexListBase)
Select	Defines the value of the type property of the event object for an event that is dispatched when a single item is selected. (Inherited from FlexListBase)
SelectIndex	Defines the value of the type property of the event object for an event that is dispatched when a single item is selected. (Inherited from FlexListBase)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key. (Inherited from FlexListBase)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)

Name	Description
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

FlexAlert Class

Description

A pop-up dialog box that can contain a message, a title, buttons (any combination of OK, Cancel, Yes, and No) and an icon.

The Alert control is modal, which means it will retain focus until the user closes it.

Inheritance Hierarchy

- [FlexPanel](#)
 - FlexAlert

Syntax

```
'Declaration  
Public Class FlexAlert _  
Inherits FlexPanel
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
backgroundAlpha	the alpha level of the color defined by the backgroundColor property, of the image or SWF file defined by the backgroundImage style. Valid values range from 0.0 to 1.0. (Inherited from FlexContainer)
backgroundColor	the background color of a component. (Inherited from FlexContainer)
backgroundDisabledColor	the background color of the component when it is disabled. The global default value is undefined. (Inherited from FlexContainer)
backgroundImage	the background image of a component. This can be an absolute or relative URL or class. (Inherited from FlexContainer)
backgroundSize	the percentage to change the image size to for the specified backgroundImage. (Inherited from FlexContainer)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
columnNames	a list containing the names of all columns in the data. (Inherited from FlexContainer)
creationIndex	the order to instantiate and draw the children of the container. (Inherited from FlexContainer)
creationPolicy	the child creation policy for this Container. (Inherited from FlexContainer)
currentState	the current view state of the component. (Inherited from FlexObject)
defaultButtonFlag	A bitflag that contains either Alert.OK, Alert.CANCEL, Alert.YES, or Alert.NO to specify the default button. The default value is Alert.OK.
dropShadowEnabled	whether the Panel container's drop shadow is visible. The default value is true. (Inherited from FlexPanel)

Name	Description
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>fillAlphas</i>	the alpha transparency values used for the background fill of components. (Inherited from <i>FlexContainer</i>)
<i>fillColors</i>	the colors used to tint the background fill of the component. (Inherited from <i>FlexContainer</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexContainer</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use. (Inherited from <i>FlexContainer</i>)
<i>fontSize</i>	the height of the text, in pixels. (Inherited from <i>FlexContainer</i>)
<i>fontStyle</i>	whether the text is italic font. (Inherited from <i>FlexContainer</i>)
<i>fontWeight</i>	whether the text is boldface. (Inherited from <i>FlexContainer</i>)
<i>footerColors</i>	the array of two colors used to draw the footer (area for the ControlBar container) background. (Inherited from <i>FlexPanel</i>)
<i>headerColors</i>	the array of two colors used to draw the header. (Inherited from <i>FlexPanel</i>)
<i>headerHeight</i>	the height of the header. The default value is based on the style of the title text. (Inherited from <i>FlexPanel</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>label</i>	the text displayed by some navigator containers to represent this Container. (Inherited from <i>FlexContainer</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexContainer</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numChildren</i>	the number of child components in this container. (Inherited from <i>FlexContainer</i>)

Name	Description
<i>numColumns</i>	the total number of columns of data available. (Inherited from <i>FlexContainer</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>FlexContainer</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or <i>explicitWidth</i> properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>status</i>	the text in the status area of the title bar. The default value is "". (Inherited from <i>FlexPanel</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>text</i>	The text to display in this alert dialog box. The default value is "".
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>title</i>	the title or caption displayed in the title bar. The default value is "". (Inherited from <i>FlexPanel</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is <i>Nothing</i> . (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <i>useHandCursor</i> is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the <i>DisplayObject</i> instance relative to the local coordinates of the parent <i>DisplayObjectContainer</i> . (Inherited from <i>FlexDisplayObject</i>)

Name	Description
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from FlexContainer)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from FlexContainer)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from FlexContainer)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)

Name	Description
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. The return value is an array of rows, each of which is an array of items. (Inherited from FlexContainer)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from FlexContainer)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)

Name	Description
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Scroll	Dispatched when the user manually scrolls the container. (Inherited from FlexContainer)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the

Name	Description
WaitForPropertyNotEquals	optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject) Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexApplication Class

Description

A default, or Application, container that lets you start adding content to your application without explicitly defining another container.

Inheritance Hierarchy

- [FlexContainer](#)
 - FlexApplication
 - [FlexWindowedApplication](#)

Syntax

```
'Declaration
Public Class FlexApplication _
Inherits FlexContainer
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)

Name	Description
<i>backgroundAlpha</i>	the alpha level of the color defined by the <code>backgroundColor</code> property, of the image or SWF file defined by the <code>backgroundImage</code> style. Valid values range from 0.0 to 1.0. (Inherited from <i>FlexContainer</i>)
<i>backgroundColor</i>	the background color of a component. (Inherited from <i>FlexContainer</i>)
<i>backgroundDisabledColor</i>	the background color of the component when it is disabled. The global default value is undefined. (Inherited from <i>FlexContainer</i>)
<i>backgroundImage</i>	the background image of a component. This can be an absolute or relative URL or class. (Inherited from <i>FlexContainer</i>)
<i>backgroundSize</i>	the percentage to change the image size to for the specified <code>backgroundImage</code> . (Inherited from <i>FlexContainer</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>FlexContainer</i>)
<i>creationIndex</i>	the order to instantiate and draw the children of the container. (Inherited from <i>FlexContainer</i>)
<i>creationPolicy</i>	the child creation policy for this Container. (Inherited from <i>FlexContainer</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>fillAlphas</i>	the alpha transparency values used for the background fill of components. (Inherited from <i>FlexContainer</i>)
<i>fillColors</i>	the colors used to tint the background fill of the component. (Inherited from <i>FlexContainer</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexContainer</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use. (Inherited from <i>FlexContainer</i>)
<i>fontSize</i>	the height of the text, in pixels. (Inherited from <i>FlexContainer</i>)
<i>fontStyle</i>	whether the text is italic font. (Inherited from <i>FlexContainer</i>)
<i>fontWeight</i>	whether the text is boldface. (Inherited from <i>FlexContainer</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)

Name	Description
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>label</i>	the text displayed by some navigator containers to represent this Container. (Inherited from <i>FlexContainer</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexContainer</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numChildren</i>	the number of child components in this container. (Inherited from <i>FlexContainer</i>)
<i>numColumns</i>	the total number of columns of data available. (Inherited from <i>FlexContainer</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>FlexContainer</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>url</i>	the URL from which this Application's SWF file was loaded.

Name	Description
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <i>useHandCursor</i> is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the <i>DisplayObject</i> instance relative to the local coordinates of the parent <i>DisplayObjectContainer</i> . (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the <i>DisplayObject</i> instance relative to the local coordinates of the parent <i>DisplayObjectContainer</i> . (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>ChangeFocus</i>	Changes the current focus. (Inherited from <i>FlexObject</i>)
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i>)
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i>)
<i>DragCancel</i>	Defines the value of the type property of the event object for a <i>dragComplete</i> event. (Inherited from <i>FlexContainer</i>)
<i>DragDrop</i>	Defines the value of the type property of the event object for a <i>dragDrop</i> event. (Inherited from <i>FlexContainer</i>)
<i>DragStart</i>	Defines the value of the type property of the event object for a <i>dragStart</i> event. (Inherited from <i>FlexContainer</i>)
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)

Name	Description
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. The return value is an array of rows, each of which is an array of items. (Inherited from FlexContainer)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)

Name	Description
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from FlexContainer)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Scroll	Dispatched when the user manually scrolls the container. (Inherited from FlexContainer)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
WaitForObject	<p>OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)</p> <p>Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code>. Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code>, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)</p>
WaitForProperty	<p>Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)</p>
WaitForPropertyNotEquals	<p>Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)</p>
WaitForScreenshotStable	<p>Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)</p>

FlexAreaChart Class

Description

Represents data as an area bounded by a line connecting the values in the data. The `AreaChart` control can be used to represent different variations, including simple areas, stacked, 100% stacked, and high/low.

Inheritance Hierarchy

- [FlexCartesianChart](#)
 - `FlexAreaChart`

Syntax

```
'Declaration
Public Class FlexAreaChart _
Inherits FlexCartesianChart
```

Properties

Name	Description
<i>alpha</i>	the alpha transparency value of the object specified. (Inherited from <i>FlexDisplayObject</i>)
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i>)
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>clipContent</i>	whether Flex clips the chart to the area bounded by the axes. Set to false to clip the chart. Set to true to avoid clipping when the data is rendered. (Inherited from <i>FlexChart</i>)
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>FlexChart</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>dataTipMode</i>	how Flex displays DataTip controls for the chart. (Inherited from <i>FlexChart</i>)
<i>description</i>	a short description of the data in the chart. (Inherited from <i>FlexChart</i>)
<i>dragEnabled</i>	whether you can drag items out of this chart and drop them on other controls. (Inherited from <i>FlexChart</i>)
<i>dropEnabled</i>	whether dragged items can be dropped onto the chart. (Inherited from <i>FlexChart</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexChart</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use. (Inherited from <i>FlexChart</i>)
<i>fontSize</i>	the height of the text, in pixels. The default value is 10 for all controls except the ColorPicker control. For the ColorPicker control, the default value is 11. (Inherited from <i>FlexChart</i>)

Name	Description
<i>gutterBottom</i>	The size of the region, in pixels, between the bottom of the chart data area and the bottom of the chart control. (Inherited from <i>FlexCartesianChart</i>)
<i>gutterLeft</i>	The size of the region, in pixels, between the left of the chart data area and the left of the chart control. (Inherited from <i>FlexCartesianChart</i>)
<i>gutterRight</i>	The size of the region, in pixels, between the right side of the chart data area and the outside of the chart control. (Inherited from <i>FlexCartesianChart</i>)
<i>gutterTop</i>	The size of the region, in pixels, between the top of the chart data area and the top of the chart control. (Inherited from <i>FlexCartesianChart</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>horizontalAxisRatio</i>	the height limit of the horizontal axis. (Inherited from <i>FlexCartesianChart</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexChart</i>)
<i>maximumDataTipCount</i>	the maximum number of datatips a chart will show. (Inherited from <i>FlexChart</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>mouseSensitivity</i>	the distance, in pixels, that Flex considers a data point to be under the mouse pointer when the pointer moves around a chart. (Inherited from <i>FlexChart</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>FlexChart</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>FlexChart</i>)
<i>paddingBottom</i>	the number of pixels between the chart's bottom border and its content area. (Inherited from <i>FlexChart</i>)
<i>paddingLeft</i>	the number of pixels between the control's left border and the left edge of its content area. The default value is 2. (Inherited from <i>FlexChart</i>)

Name	Description
paddingRight	the number of pixels between the control's right border and the right edge of its content area. The default value is 0. (Inherited from FlexChart)
paddingTop	the number of pixels between the chart's top border and its content area. (Inherited from FlexChart)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from FlexObject)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from FlexObject)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from FlexObject)
scaleY	the number that specifies the vertical scaling factor. (Inherited from FlexObject)
selectedChartItem	the selected ChartItem in the chart. If multiple items are selected, this property specifies the most recently selected item. (Inherited from FlexChart)
selectedChartItems	an array of all the selected ChartItem objects in the chart. (Inherited from FlexChart)
selectionMode	whether ChartItem objects can be selected. (Inherited from FlexChart)
showDataTips	whether DataTip controls for the chart show. (Inherited from FlexChart)
showDataTipTargets	whether to show targets over the datapoints when showDataTips is set to true. (Inherited from FlexChart)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from FlexDisplayObject)
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TestObject)
textAlign	the alignment of text within a container. (Inherited from FlexCartesianChart)
themeColor	the theme color of a component. (Inherited from FlexObject)
toolTip	the text to display in the ToolTip. The default value is Nothing. (Inherited from FlexObject)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from FlexObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Name	Description
verticalAxisRatio	the width limit of the vertical axis. (Inherited from FlexCartesianChart)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from FlexChart)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from FlexChart)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from FlexChart)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)

Name	Description
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from FlexChart)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)

Name	Description
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Select	Defines the value of the type property of the event object for a headerRelease event, which indicates that the user pressed and released the mouse on a column header. (Inherited from FlexChart)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown.

Name	Description
	The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexAreaSeries Class

Description

Defines a data series for an AreaChart control.

Inheritance Hierarchy

- [FlexChartSeries](#)
 - FlexAreaSeries

Syntax

```
'Declaration
Public Class FlexAreaSeries _
Inherits FlexChartSeries
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)

Name	Description
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i>)
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>FlexChartSeries</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexChartSeries</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>form</i>	the boundary type for the area.
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexChartSeries</i>)
<i>minField</i>	the field of the dataProvider that determines the bottom boundary of the area.
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>FlexChartSeries</i>)

Name	Description
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>FlexChartSeries</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>radius</i>	the radius, in pixels, of the chart elements for the data points.
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectedIndex</i>	the index of the selected item in the data provider of the series. (Inherited from <i>FlexChartSeries</i>)
<i>selectedIndices</i>	an array of indexes of the selected items in the data provider of the series. (Inherited from <i>FlexChartSeries</i>)
<i>selectedItem</i>	the chart item that is selected in the series. (Inherited from <i>FlexChartSeries</i>)
<i>selectedItems</i>	an array of chart items that are selected in the series. (Inherited from <i>FlexChartSeries</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)

Name	Description
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>xField</i>	the field of the data provider that determines the position of the data points on the horizontal axis.
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>yField</i>	the field of the data provider that determines the position of the data point on the vertical axis.

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>ChangeFocus</i>	Changes the current focus. (Inherited from <i>FlexObject</i>)
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i>)
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i>)
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <i>TestObject</i>)

Name	Description
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from FlexChartSeries)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)

Name	Description
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SeriesClick	Indicates that the user clicked the mouse button over a chart item representing data in the chart. (Inherited from FlexChartSeries)
SeriesDoubleClick	Indicates that the user double-clicked the mouse button over a chart item representing data in the chart. (Inherited from FlexChartSeries)
SeriesItemRollOver	Indicates that the user rolled the mouse pointer over a chart item representing data in the chart. (Inherited from FlexChartSeries)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider

Name	Description
<i>WaitForObject</i>	increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

FlexAxisRenderer Class

Description

Describe the horizontal and vertical axes of a chart. An axis is responsible for rendering the labels, tick marks, and title along its length.

AxisRenderer objects inherit some of their visual properties from the enclosing chart object. The text format of the labels and title defaults to the CSS text properties of the renderer. You can control the formatting of the axis title separately by specifying a `axisTitleStyleName`, either on the AxisRenderer or on the enclosing chart.

Inheritance Hierarchy

- *FlexObject*
 - FlexAxisRenderer

Syntax

```
'Declaration
Public Class FlexAxisRenderer _
Inherits FlexObject
```

Properties

Name	Description
<i>alpha</i>	the alpha transparency value of the object specified. (Inherited from <i>FlexDisplayObject</i>)
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i>)

Name	Description
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>canDropLabels</i>	whether the AxisRenderer should drop labels as necessary to lay out correctly.
<i>canStagger</i>	whether to stagger labels on two label rows. Use this setting to minimize the space required for the labels. The default value is true, which staggers the labels.
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>columnNames</i>	a list containing the names of all columns in the data.
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child.
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>heightLimit</i>	the maximum amount of space, in pixels, that an axis renderer will take from a chart.
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>labelGap</i>	the gap between the end of the tick marks and the top of the labels, in pixels. The default value is 3.
<i>labelRotation</i>	the label rotation.
<i>lastVisibleRow</i>	the index of the last visible child.
<i>length</i>	the length of the axis, in screen coordinates.
<i>minorTickLength</i>	the length of the minor tick marks on the axis, in pixels. The default value is 0.
<i>minorTickPlacement</i>	a value where to draw the minor tick marks. Values include: <i>inside</i> , <i>outside</i> , <i>cross</i> , and <i>none</i> .
<i>minorTicks</i>	an array that specifies where Flex draws the minor tick marks along the axis. Each array element contains a value between 0 and 1.
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that

Name	Description
	is on the display list receives mouse events. If <code>mouseEnabled</code> is set to <code>false</code> , the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the <code>mouseEnabled</code> behavior for all children of an object on the display list, use <code>flash.display.DisplayObjectContainer.mouseChildren</code> . (Inherited from FlexDisplayObject)
numAutomationChildren	the number of automation children this container has. (Inherited from FlexObject)
numColumns	the total number of columns in the data available.
numRows	the total number of rows of data available.
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from FlexObject)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the <code>width</code> or <code>explicitWidth</code> properties resets this property to NaN. (Inherited from FlexObject)
placement	the side of the chart that the <code>axisRenderer</code> appears on.
scaleX	the number that specifies the horizontal scaling factor. (Inherited from FlexObject)
scaleY	the number that specifies the vertical scaling factor. (Inherited from FlexObject)
showLabels	whether labels appear along the axis. The default value is <code>true</code> .
showLine	whether to display the axis. The default value is <code>true</code> .
tabChildren	whether the children of the display object are tab enabled. The default is <code>true</code> . (Inherited from FlexDisplayObject)
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TestObject)
themeColor	the theme color of a component. (Inherited from FlexObject)
tickLength	the length of the tick marks on the axis, in pixels. The default value is 3.
tickPlacement	a value where to draw the tick marks. Values include: <i>inside</i> , <i>outside</i> , <i>cross</i> , and <i>none</i> .
ticks	an array that specifies where Flex draws the tick marks along the axis. Each array element contains a value between 0 and 1.
toolTip	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from FlexObject)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is <code>true</code> . If <code>useHandCursor</code> is <code>false</code> , the arrow pointer is used instead. (Inherited from FlexObject)

Name	Description
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>ChangeFocus</i>	Changes the current focus. (Inherited from <i>FlexObject</i>)
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i>)
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i>)
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components.
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)

Name	Description
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexBarChart Class

Description

Represents data as a series of horizontal bars whose length is determined by values in the data. A BarChart control can represent different chart variations, including simple bars, clustered bars, stacked, 100% stacked, and high/low.

Inheritance Hierarchy

- [FlexCartesianChart](#)
 - FlexBarChart

Syntax

```
'Declaration
Public Class FlexBarChart _
Inherits FlexCartesianChart
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
barWidthRatio	how wide to draw the bars relative to the category width, as a percentage in the range of 0 to 1.
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)

Name	Description
<i>clipContent</i>	whether Flex clips the chart to the area bounded by the axes. Set to false to clip the chart. Set to true to avoid clipping when the data is rendered. (Inherited from <i>FlexChart</i>)
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>FlexChart</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>dataTipMode</i>	how Flex displays DataTip controls for the chart. (Inherited from <i>FlexChart</i>)
<i>description</i>	a short description of the data in the chart. (Inherited from <i>FlexChart</i>)
<i>dragEnabled</i>	whether you can drag items out of this chart and drop them on other controls. (Inherited from <i>FlexChart</i>)
<i>dropEnabled</i>	whether dragged items can be dropped onto the chart. (Inherited from <i>FlexChart</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexChart</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use. (Inherited from <i>FlexChart</i>)
<i>fontSize</i>	the height of the text, in pixels. The default value is 10 for all controls except the ColorPicker control. For the ColorPicker control, the default value is 11. (Inherited from <i>FlexChart</i>)
<i>gutterBottom</i>	The size of the region, in pixels, between the bottom of the chart data area and the bottom of the chart control. (Inherited from <i>FlexCartesianChart</i>)
<i>gutterLeft</i>	The size of the region, in pixels, between the left of the chart data area and the left of the chart control. (Inherited from <i>FlexCartesianChart</i>)
<i>gutterRight</i>	The size of the region, in pixels, between the right side of the chart data area and the outside of the chart control. (Inherited from <i>FlexCartesianChart</i>)
<i>gutterTop</i>	The size of the region, in pixels, between the top of the chart data area and the top of the chart control. (Inherited from <i>FlexCartesianChart</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)

Name	Description
<i>horizontalAxisRatio</i>	the height limit of the horizontal axis. (Inherited from <i>FlexCartesianChart</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexChart</i>)
<i>maxBarWidth</i>	how wide to draw the bars, in pixels.
<i>maximumDataTipCount</i>	the maximum number of datatips a chart will show. (Inherited from <i>FlexChart</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>mouseSensitivity</i>	the distance, in pixels, that Flex considers a data point to be under the mouse pointer when the pointer moves around a chart. (Inherited from <i>FlexChart</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>FlexChart</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>FlexChart</i>)
<i>paddingBottom</i>	the number of pixels between the chart's bottom border and its content area. (Inherited from <i>FlexChart</i>)
<i>paddingLeft</i>	the number of pixels between the control's left border and the left edge of its content area. The default value is 2. (Inherited from <i>FlexChart</i>)
<i>paddingRight</i>	the number of pixels between the control's right border and the right edge of its content area. The default value is 0. (Inherited from <i>FlexChart</i>)
<i>paddingTop</i>	the number of pixels between the chart's top border and its content area. (Inherited from <i>FlexChart</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)

Name	Description
<i>selectedChartItem</i>	the selected ChartItem in the chart. If multiple items are selected, this property specifies the most recently selected item. (Inherited from <i>FlexChart</i>)
<i>selectedChartItems</i>	an array of all the selected ChartItem objects in the chart. (Inherited from <i>FlexChart</i>)
<i>selectionMode</i>	whether ChartItem objects can be selected. (Inherited from <i>FlexChart</i>)
<i>showDataTips</i>	whether DataTip controls for the chart show. (Inherited from <i>FlexChart</i>)
<i>showDataTipTargets</i>	whether to show targets over the datapoints when showDataTips is set to true. (Inherited from <i>FlexChart</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>textAlign</i>	the alignment of text within a container. (Inherited from <i>FlexCartesianChart</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>verticalAxisRatio</i>	the width limit of the vertical axis. (Inherited from <i>FlexCartesianChart</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from FlexChart)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from FlexChart)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from FlexChart)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject . (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from FlexChart)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Select	Defines the value of the type property of the event object for a headerRelease event, which indicates that the user pressed and released the mouse on a column header. (Inherited from FlexChart)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)

Name	Description
 SetProperty 	Sets the value of the specified property. (Inherited from TestObject)
 TextCapture 	Returns the text in this object's visible area. (Inherited from TestObject)
 TextClick 	Clicks in the center of the specified text. (Inherited from TestObject)
 TextExists 	Returns whether the specified text exists. (Inherited from TestObject)
 TextRectangle 	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
 ToString 	Returns a string representation of the control. (Inherited from FlexDisplayObject)
 TypeKeys 	Sends a set of keystrokes to the object. (Inherited from IKeyable)
 TypePasswordKeys 	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
 WaitForChildDisappearance 	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForDisappearance 	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForObject 	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
 WaitForProperty 	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForPropertyNotEquals 	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexBarSeries Class

Description

Defines a data series for a BarChart control.

Inheritance Hierarchy

- [FlexChartSeries](#)
 - FlexBarSeries

Syntax

```
'Declaration
Public Class FlexBarSeries _
Inherits FlexChartSeries
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
barWidthRatio	the width to render the bars relative to the category width.
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
columnNames	a list containing the names of all columns in the data. (Inherited from FlexChartSeries)
currentState	the current view state of the component. (Inherited from FlexObject)
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)

Name	Description
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexChartSeries</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexChartSeries</i>)
<i>maxBarWidth</i>	the width of the bars, in pixels.
<i>minField</i>	the field of the data provider that determines the bottom of each bar.
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>FlexChartSeries</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>FlexChartSeries</i>)
<i>offset</i>	the amount to offset the center of the bars from the center of the available space, relative to the category width.
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectedIndex</i>	the index of the selected item in the data provider of the series. (Inherited from <i>FlexChartSeries</i>)

Name	Description
<i>selectedIndices</i>	an array of indexes of the selected items in the data provider of the series. (Inherited from <i>FlexChartSeries</i>)
<i>selectedItem</i>	the chart item that is selected in the series. (Inherited from <i>FlexChartSeries</i>)
<i>selectedItems</i>	an array of chart items that are selected in the series. (Inherited from <i>FlexChartSeries</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <i>useHandCursor</i> is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the <i>DisplayObject</i> instance relative to the local coordinates of the parent <i>DisplayObjectContainer</i> . (Inherited from <i>FlexDisplayObject</i>)
<i>xField</i>	the field of the data provider that determines the x-axis location of the top of each bar.
<i>y</i>	the y coordinate of the <i>DisplayObject</i> instance relative to the local coordinates of the parent <i>DisplayObjectContainer</i> . (Inherited from <i>FlexDisplayObject</i>)
<i>yField</i>	the field of the data provider that determines the y-axis location of the bottom of each bar in the chart.

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha

Name	Description
	channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject . (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from FlexChartSeries)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)

Name	Description
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SeriesClick	Indicates that the user clicked the mouse button over a chart item representing data in the chart. (Inherited from FlexChartSeries)
SeriesDoubleClick	Indicates that the user double-clicked the mouse button over a chart item representing data in the chart. (Inherited from FlexChartSeries)
SeriesItemRollOver	Indicates that the user rolled the mouse pointer over a chart item representing data in the chart. (Inherited from FlexChartSeries)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)

Name	Description
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexBox Class

Description

A Box container lays out its children in a single vertical column or a single horizontal row.

Inheritance Hierarchy

- [FlexContainer](#)
 - FlexBox
 - [FlexDividedBox](#)
 - [FlexNavigationBar](#)

Syntax

```
'Declaration  
Public Class FlexBox _  
Inherits FlexContainer
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
backgroundAlpha	the alpha level of the color defined by the backgroundColor property, of the image or SWF file defined by the backgroundImage style. Valid values range from 0.0 to 1.0. (Inherited from FlexContainer)
backgroundColor	the background color of a component. (Inherited from FlexContainer)
backgroundDisabledColor	the background color of the component when it is disabled. The global default value is undefined. (Inherited from FlexContainer)
backgroundImage	the background image of a component. This can be an absolute or relative URL or class. (Inherited from FlexContainer)
backgroundSize	the percentage to change the image size to for the specified backgroundImage . (Inherited from FlexContainer)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
columnNames	a list containing the names of all columns in the data. (Inherited from FlexContainer)
creationIndex	the order to instantiate and draw the children of the container. (Inherited from FlexContainer)

Name	Description
<i>creationPolicy</i>	the child creation policy for this Container. (Inherited from <i>FlexContainer</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>direction</i>	whether to use vertical (default) or horizontal layout.
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>fillAlphas</i>	the alpha transparency values used for the background fill of components. (Inherited from <i>FlexContainer</i>)
<i>fillColors</i>	the colors used to tint the background fill of the component. (Inherited from <i>FlexContainer</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexContainer</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use. (Inherited from <i>FlexContainer</i>)
<i>fontSize</i>	the height of the text, in pixels. (Inherited from <i>FlexContainer</i>)
<i>fontStyle</i>	whether the text is italic font. (Inherited from <i>FlexContainer</i>)
<i>fontWeight</i>	whether the text is boldface. (Inherited from <i>FlexContainer</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>horizontalAlign</i>	the horizontal alignment of children in the container.
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>label</i>	the text displayed by some navigator containers to represent this Container. (Inherited from <i>FlexContainer</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexContainer</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numChildren</i>	the number of child components in this container. (Inherited from <i>FlexContainer</i>)

Name	Description
<i>numColumns</i>	the total number of columns of data available. (Inherited from <i>FlexContainer</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>FlexContainer</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or <i>explicitWidth</i> properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is <i>Nothing</i> . (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <i>useHandCursor</i> is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>verticalAlign</i>	the vertical alignment of children in the container.
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from FlexContainer)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from FlexContainer)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from FlexContainer)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. The return value is an array of rows, each of which is an array of items. (Inherited from FlexContainer)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from FlexContainer)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Scroll	Dispatched when the user manually scrolls the container. (Inherited from FlexContainer)

Name	Description
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout

Name	Description
	specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexBubbleChart Class

Description

Represents data with three values for each data point. Each data point is defined by a value determining its position along the horizontal axis, a value determining its position along the vertical axis, and a value determining the size of the chart element, relative to the other data points on the chart.

Inheritance Hierarchy

- [FlexCartesianChart](#)
 - FlexBubbleChart

Syntax

```
'Declaration
Public Class FlexBubbleChart _
Inherits FlexCartesianChart
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
clipContent	whether Flex clips the chart to the area bounded by the axes. Set to false to clip the chart. Set to true to avoid clipping when the data is rendered. (Inherited from FlexChart)
columnNames	a list containing the names of all columns in the data. (Inherited from FlexChart)

Name	Description
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>dataTipMode</i>	how Flex displays DataTip controls for the chart. (Inherited from <i>FlexChart</i>)
<i>description</i>	a short description of the data in the chart. (Inherited from <i>FlexChart</i>)
<i>dragEnabled</i>	whether you can drag items out of this chart and drop them on other controls. (Inherited from <i>FlexChart</i>)
<i>dropEnabled</i>	whether dragged items can be dropped onto the chart. (Inherited from <i>FlexChart</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexChart</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use. (Inherited from <i>FlexChart</i>)
<i>fontSize</i>	the height of the text, in pixels. The default value is 10 for all controls except the ColorPicker control. For the ColorPicker control, the default value is 11. (Inherited from <i>FlexChart</i>)
<i>gutterBottom</i>	The size of the region, in pixels, between the bottom of the chart data area and the bottom of the chart control. (Inherited from <i>FlexCartesianChart</i>)
<i>gutterLeft</i>	The size of the region, in pixels, between the left of the chart data area and the left of the chart control. (Inherited from <i>FlexCartesianChart</i>)
<i>gutterRight</i>	The size of the region, in pixels, between the right side of the chart data area and the outside of the chart control. (Inherited from <i>FlexCartesianChart</i>)
<i>gutterTop</i>	The size of the region, in pixels, between the top of the chart data area and the top of the chart control. (Inherited from <i>FlexCartesianChart</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>horizontalAxisRatio</i>	the height limit of the horizontal axis. (Inherited from <i>FlexCartesianChart</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexChart</i>)

Name	Description
<i>maximumDataTipCount</i>	the maximum number of datatips a chart will show. (Inherited from <i>FlexChart</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>mouseSensitivity</i>	the distance, in pixels, that Flex considers a data point to be under the mouse pointer when the pointer moves around a chart. (Inherited from <i>FlexChart</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>FlexChart</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>FlexChart</i>)
<i>paddingBottom</i>	the number of pixels between the chart's bottom border and its content area. (Inherited from <i>FlexChart</i>)
<i>paddingLeft</i>	the number of pixels between the control's left border and the left edge of its content area. The default value is 2. (Inherited from <i>FlexChart</i>)
<i>paddingRight</i>	the number of pixels between the control's right border and the right edge of its content area. The default value is 0. (Inherited from <i>FlexChart</i>)
<i>paddingTop</i>	the number of pixels between the chart's top border and its content area. (Inherited from <i>FlexChart</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectedChartItem</i>	the selected ChartItem in the chart. If multiple items are selected, this property specifies the most recently selected item. (Inherited from <i>FlexChart</i>)
<i>selectedChartItems</i>	an array of all the selected ChartItem objects in the chart. (Inherited from <i>FlexChart</i>)

Name	Description
<i>selectionMode</i>	whether ChartItem objects can be selected. (Inherited from <i>FlexChart</i>)
<i>showDataTips</i>	whether DataTip controls for the chart show. (Inherited from <i>FlexChart</i>)
<i>showDataTipTargets</i>	whether to show targets over the datapoints when showDataTips is set to true. (Inherited from <i>FlexChart</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>textAlign</i>	the alignment of text within a container. (Inherited from <i>FlexCartesianChart</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>verticalAxisRatio</i>	the width limit of the vertical axis. (Inherited from <i>FlexCartesianChart</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha

Name	Description
	channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from FlexChart)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from FlexChart)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from FlexChart)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)

Name	Description
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from FlexChart)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Select	Defines the value of the type property of the event object for a headerRelease event, which indicates that the user pressed and released the mouse on a column header. (Inherited from FlexChart)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)

Name	Description
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexBubbleSeries Class

Description

Defines a data series for a BubbleChart control.

Inheritance Hierarchy

- [FlexChartSeries](#)
 - FlexBubbleSeries

Syntax

```
'Declaration
Public Class FlexBubbleSeries _
Inherits FlexChartSeries
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
columnNames	a list containing the names of all columns in the data. (Inherited from FlexChartSeries)
currentState	the current view state of the component. (Inherited from FlexObject)
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from FlexObject)
firstVisibleRow	the index of the first visible child. (Inherited from FlexChartSeries)

Name	Description
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexChartSeries</i>)
<i>maxRadius</i>	The radius of the largest item rendered in this series.
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>FlexChartSeries</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>FlexChartSeries</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>radiusField</i>	the field of the data provider that determines the radius of each symbol, relative to the other data points in the chart.
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectedIndex</i>	the index of the selected item in the data provider of the series. (Inherited from <i>FlexChartSeries</i>)
<i>selectedIndices</i>	an array of indexes of the selected items in the data provider of the series. (Inherited from <i>FlexChartSeries</i>)
<i>selectedItem</i>	the chart item that is selected in the series. (Inherited from <i>FlexChartSeries</i>)
<i>selectedItems</i>	an array of chart items that are selected in the series. (Inherited from <i>FlexChartSeries</i>)

Name	Description
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>xField</i>	the field of the data provider that determines the x-axis location of each data point.
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>yField</i>	the field of the data provider that determines the y-axis location of each data point.

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>ChangeFocus</i>	Changes the current focus. (Inherited from <i>FlexObject</i>)
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i>)

Name	Description
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from FlexChartSeries)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)

Name	Description
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SeriesClick	Indicates that the user clicked the mouse button over a chart item representing data in the chart. (Inherited from FlexChartSeries)
SeriesDoubleClick	Indicates that the user double-clicked the mouse button over a chart item representing data in the chart. (Inherited from FlexChartSeries)
SeriesItemRollOver	Indicates that the user rolled the mouse pointer over a chart item representing data in the chart. (Inherited from FlexChartSeries)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)

Name	Description
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexButton Class

Description

The Button control is a commonly used rectangular button. Button controls look like they can be pressed. They can have a text label, an icon, or both on their face.

Buttons typically use event listeners to perform an action when the user selects the control. When a user clicks the mouse on a Button control, and the Button control is enabled, it dispatches a click event and a

buttonDown event. A button always dispatches events such as the mouseMove, mouseOver, mouseOut, rollover, rollover, mouseDown, and mouseUp events whether enabled or disabled.

You can customize the look of a Button control and change its functionality from a push button to a toggle button. You can change the button appearance by using a skin for each of the button's states.

The label of a Button control uses a bold typeface. If you embed a font that you want to use for the label of the Button control, you must embed the bold typeface.

 - *FlexPopUpButton*
 - *FlexRadioButton*

Syntax

```
'Declaration  
Public Class FlexButton _  
Inherits FlexObject
```

Properties

Name	Description
<i>alpha</i>	the alpha transparency value of the object specified. (Inherited from <i>FlexDisplayObject</i>)
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i>)
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>color</i>	the color of text in the component, including the component label. The default value is 0x0B333C.
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>disabledColor</i>	the color of text in the component if it is disabled. The default value is 0xAAB3B3.
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)

Name	Description
<i>fillAlphas</i>	the alphas used for the background fill of controls.
<i>fillColors</i>	the colors used to tint the background of the control.
<i>focusAlpha</i>	the alpha transparency value of the focus skin. The default value is 0.4.
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use.
<i>fontSize</i>	the height of the text, in pixels.
<i>fontStyle</i>	whether the text is italic font.
<i>fontWeight</i>	whether the text is boldface.
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>label</i>	the text to appear on the Button control.
<i>labelPlacement</i>	the orientation of the label in relation to a specified icon.
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selected</i>	whether a toggle button is toggled on (true) or off (false).
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)

Name	Description
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>textAlign</i>	the alignment of text within a container.
<i>textDecoration</i>	whether the text is underlined.
<i>textIndent</i>	the offset of the first line of text from the left side of the container, in pixels. The default value is 0.
<i>textRollOverColor</i>	the text color of the label as the user moves the mouse pointer over the button. The default value is 0x2B333C.
<i>textSelectedColor</i>	the text color of the label as the user presses it. The default value is 0x000000.
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toggle</i>	whether a Button is in a toggle state or not.
<i>toolTip</i>	the text to display in the ToolTip. The default value is <i>Nothing</i> . (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <i>useHandCursor</i> is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>ChangeFocus</i>	Changes the current focus. (Inherited from <i>FlexObject</i>)
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i>)

Name	Description
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)

Name	Description
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout

Name	Description
WaitForObject	parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject) Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option OPT_WAIT_RESOLVE_OBJDEF. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexButtonBar Class

Description

Defines a horizontal or vertical group of logically related push buttons with a common look and navigation.

Inheritance Hierarchy

- [FlexNavigationBar](#)
 - FlexButtonBar
 - [FlexToggleButtonBar](#)

Syntax

```
'Declaration
Public Class FlexButtonBar _
Inherits FlexNavigationBar
```

Properties

Name	Description
<i>alpha</i>	the alpha transparency value of the object specified. (Inherited from <i>FlexDisplayObject</i>)
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i>)
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>backgroundAlpha</i>	the alpha level of the color defined by the <i>backgroundColor</i> property, of the image or SWF file defined by the <i>backgroundImage</i> style. Valid values range from 0.0 to 1.0. (Inherited from <i>FlexContainer</i>)
<i>backgroundColor</i>	the background color of a component. (Inherited from <i>FlexContainer</i>)
<i>backgroundDisabledColor</i>	the background color of the component when it is disabled. The global default value is undefined. (Inherited from <i>FlexContainer</i>)
<i>backgroundImage</i>	the background image of a component. This can be an absolute or relative URL or class. (Inherited from <i>FlexContainer</i>)
<i>backgroundSize</i>	the percentage to change the image size to for the specified <i>backgroundImage</i> . (Inherited from <i>FlexContainer</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>FlexContainer</i>)
<i>creationIndex</i>	the order to instantiate and draw the children of the container. (Inherited from <i>FlexContainer</i>)
<i>creationPolicy</i>	the child creation policy for this Container. (Inherited from <i>FlexContainer</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>direction</i>	whether to use vertical (default) or horizontal layout. (Inherited from <i>FlexBox</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>fillAlphas</i>	the alpha transparency values used for the background fill of components. (Inherited from <i>FlexContainer</i>)

Name	Description
<i>fillColors</i>	the colors used to tint the background fill of the component. (Inherited from <i>FlexContainer</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexContainer</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use. (Inherited from <i>FlexContainer</i>)
<i>fontSize</i>	the height of the text, in pixels. (Inherited from <i>FlexContainer</i>)
<i>fontStyle</i>	whether the text is italic font. (Inherited from <i>FlexContainer</i>)
<i>fontWeight</i>	whether the text is boldface. (Inherited from <i>FlexContainer</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>horizontalAlign</i>	the horizontal alignment of children in the container. (Inherited from <i>FlexBox</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>label</i>	the text displayed by some navigator containers to represent this Container. (Inherited from <i>FlexContainer</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexContainer</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numChildren</i>	the number of child components in this container. (Inherited from <i>FlexContainer</i>)
<i>numColumns</i>	the total number of columns of data available. (Inherited from <i>FlexContainer</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>FlexContainer</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)

Name	Description
scaleY	the number that specifies the vertical scaling factor. (Inherited from FlexObject)
selectedIndex	the index of the active navigation item, where the first item is at an index of 0. The default value is -1. (Inherited from FlexNavigationBar)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from FlexDisplayObject)
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TestObject)
themeColor	the theme color of a component. (Inherited from FlexObject)
toolTip	the text to display in the ToolTip. The default value is Nothing. (Inherited from FlexObject)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from FlexObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
verticalAlign	the vertical alignment of children in the container. (Inherited from FlexBox)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)

Name	Description
Change	Defines the value of the type property of the event object for an <code>ItemClick</code> event. (Inherited from FlexNavigationBar)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Defines the value of the type property of the event object for a <code>dragComplete</code> event. (Inherited from FlexContainer)
DragDrop	Defines the value of the type property of the event object for a <code>dragDrop</code> event. (Inherited from FlexContainer)
DragStart	Defines the value of the type property of the event object for a <code>dragStart</code> event. (Inherited from FlexContainer)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this <code>TestObject</code> . (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)

Name	Description
GetValues	Returns a matrix containing the automation values of all parts of the components. The return value is an array of rows, each of which is an array of items. (Inherited from FlexContainer)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from FlexContainer)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Scroll	Dispatched when the user manually scrolls the container. (Inherited from FlexContainer)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)

Name	Description
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key. (Inherited from FlexNavigationBar)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If

Name	Description
	you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexCandlestickChart Class

Description

Represents financial data as a series of candlesticks representing the high, low, opening, and closing values of a data series.

The top and bottom of the vertical line in each candlestick represent the high and low values for the datapoint, while the top and bottom of the filled box represents the opening and closing values. Each candlestick is filled differently depending on whether the closing value for the datapoint is higher or lower than the opening value.

Inheritance Hierarchy

- [FlexCartesianChart](#)
 - FlexCandlestickChart

Syntax

```
'Declaration
Public Class FlexCandlestickChart _
Inherits FlexCartesianChart
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
clipContent	whether Flex clips the chart to the area bounded by the axes. Set to false to clip the chart. Set to true to avoid clipping when the data is rendered. (Inherited from FlexChart)
columnNames	a list containing the names of all columns in the data. (Inherited from FlexChart)
columnWidthRatio	a ratio of how wide to draw the candlesticks relative to the horizontal axis's category widths, as a percentage in the range of 0 to 1.

Name	Description
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>dataTipMode</i>	how Flex displays DataTip controls for the chart. (Inherited from <i>FlexChart</i>)
<i>description</i>	a short description of the data in the chart. (Inherited from <i>FlexChart</i>)
<i>dragEnabled</i>	whether you can drag items out of this chart and drop them on other controls. (Inherited from <i>FlexChart</i>)
<i>dropEnabled</i>	whether dragged items can be dropped onto the chart. (Inherited from <i>FlexChart</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexChart</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use. (Inherited from <i>FlexChart</i>)
<i>fontSize</i>	the height of the text, in pixels. The default value is 10 for all controls except the ColorPicker control. For the ColorPicker control, the default value is 11. (Inherited from <i>FlexChart</i>)
<i>gutterBottom</i>	The size of the region, in pixels, between the bottom of the chart data area and the bottom of the chart control. (Inherited from <i>FlexCartesianChart</i>)
<i>gutterLeft</i>	The size of the region, in pixels, between the left of the chart data area and the left of the chart control. (Inherited from <i>FlexCartesianChart</i>)
<i>gutterRight</i>	The size of the region, in pixels, between the right side of the chart data area and the outside of the chart control. (Inherited from <i>FlexCartesianChart</i>)
<i>gutterTop</i>	The size of the region, in pixels, between the top of the chart data area and the top of the chart control. (Inherited from <i>FlexCartesianChart</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>horizontalAxisRatio</i>	the height limit of the horizontal axis. (Inherited from <i>FlexCartesianChart</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexChart</i>)

Name	Description
<i>maxColumnWidth</i>	how wide to draw the candlesticks, in pixels.
<i>maximumDataTipCount</i>	the maximum number of datatips a chart will show. (Inherited from <i>FlexChart</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>mouseSensitivity</i>	the distance, in pixels, that Flex considers a data point to be under the mouse pointer when the pointer moves around a chart. (Inherited from <i>FlexChart</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>FlexChart</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>FlexChart</i>)
<i>paddingBottom</i>	the number of pixels between the chart's bottom border and its content area. (Inherited from <i>FlexChart</i>)
<i>paddingLeft</i>	the number of pixels between the control's left border and the left edge of its content area. The default value is 2. (Inherited from <i>FlexChart</i>)
<i>paddingRight</i>	the number of pixels between the control's right border and the right edge of its content area. The default value is 0. (Inherited from <i>FlexChart</i>)
<i>paddingTop</i>	the number of pixels between the chart's top border and its content area. (Inherited from <i>FlexChart</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectedChartItem</i>	the selected ChartItem in the chart. If multiple items are selected, this property specifies the most recently selected item. (Inherited from <i>FlexChart</i>)

Name	Description
<i>selectedChartItems</i>	an array of all the selected ChartItem objects in the chart. (Inherited from <i>FlexChart</i>)
<i>selectionMode</i>	whether ChartItem objects can be selected. (Inherited from <i>FlexChart</i>)
<i>showDataTips</i>	whether DataTip controls for the chart show. (Inherited from <i>FlexChart</i>)
<i>showDataTipTargets</i>	whether to show targets over the datapoints when showDataTips is set to true. (Inherited from <i>FlexChart</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TextObject</i>)
<i>textAlign</i>	the alignment of text within a container. (Inherited from <i>FlexCartesianChart</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TextObject</i>)
<i>verticalAxisRatio</i>	the width limit of the vertical axis. (Inherited from <i>FlexCartesianChart</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location

Name	Description
	<p>on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)</p>
<i>ChangeFocus</i>	Changes the current focus. (Inherited from <i>FlexObject</i>)
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i>)
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i>)
<i>DragCancel</i>	Defines the value of the type property of the event object for a dragComplete event. (Inherited from <i>FlexChart</i>)
<i>DragDrop</i>	Defines the value of the type property of the event object for a dragDrop event. (Inherited from <i>FlexChart</i>)
<i>DragStart</i>	Defines the value of the type property of the event object for a dragStart event. (Inherited from <i>FlexChart</i>)
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <i>TestObject</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)

Name	Description
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from FlexChart)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Select	Defines the value of the type property of the event object for a headerRelease event, which indicates that the user pressed and released the mouse on a column header. (Inherited from FlexChart)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)

Name	Description
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If

Name	Description
	you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexCandlestickSeries Class

Description

Represents financial data as a series of candlesticks representing the high, low, opening, and closing values of a data series.

The top and bottom of the vertical line in each candlestick represent the high and low values for the datapoint, while the top and bottom of the filled box represent the opening and closing values. Each candlestick is filled differently depending on whether the closing value for the datapoint is higher or lower than the opening value.

Inheritance Hierarchy

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
columnNames	a list containing the names of all columns in the data. (Inherited from FlexChartSeries)
columnWidthRatio	the width of elements relative to the category width. (Inherited from FlexHLOCSeriesBase)
currentState	the current view state of the component. (Inherited from FlexObject)

Name	Description
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from FlexObject)
firstVisibleRow	the index of the first visible child. (Inherited from FlexChartSeries)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from FlexObject)
height	the height of the display object, in pixels. (Inherited from FlexDisplayObject)
id	the ID of the component. (Inherited from FlexObject)
lastVisibleRow	the index of the last visible child. (Inherited from FlexChartSeries)
maxColumnWidth	the width of the elements, in pixels. (Inherited from FlexHLOCSeriesBase)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from FlexDisplayObject)
numAutomationChildren	the number of automation children this container has. (Inherited from FlexObject)
numColumns	the total number of columns in the data available. (Inherited from FlexChartSeries)
numRows	the total number of rows of data available. (Inherited from FlexChartSeries)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from FlexObject)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from FlexObject)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from FlexObject)
scaleY	the number that specifies the vertical scaling factor. (Inherited from FlexObject)
selectedIndex	the index of the selected item in the data provider of the series. (Inherited from FlexChartSeries)

Name	Description
<i>selectedIndices</i>	an array of indexes of the selected items in the data provider of the series. (Inherited from <i>FlexChartSeries</i>)
<i>selectedItem</i>	the chart item that is selected in the series. (Inherited from <i>FlexChartSeries</i>)
<i>selectedItems</i>	an array of chart items that are selected in the series. (Inherited from <i>FlexChartSeries</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <i>useHandCursor</i> is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the <i>DisplayObject</i> instance relative to the local coordinates of the parent <i>DisplayObjectContainer</i> . (Inherited from <i>FlexDisplayObject</i>)
<i>xField</i>	the field of the data provider that determines the x-axis location of the element. (Inherited from <i>FlexHLOCSeriesBase</i>)
<i>y</i>	the y coordinate of the <i>DisplayObject</i> instance relative to the local coordinates of the parent <i>DisplayObjectContainer</i> . (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant

Name	Description
	<i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject . (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from FlexChartSeries)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)

Name	Description
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SeriesClick	Indicates that the user clicked the mouse button over a chart item representing data in the chart. (Inherited from FlexChartSeries)
SeriesDoubleClick	Indicates that the user double-clicked the mouse button over a chart item representing data in the chart. (Inherited from FlexChartSeries)
SeriesItemRollOver	Indicates that the user rolled the mouse pointer over a chart item representing data in the chart. (Inherited from FlexChartSeries)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)

Name	Description
<i>ToString</i>	Returns a string representation of the control. (Inherited from <i>FlexDisplayObject</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

FlexCanvas Class

Description

A Canvas layout container defines a rectangular region in which you place child containers and controls. It is the only container that lets you explicitly specify the location of its children within the container by using the x and y properties of each child.

Flex sets the children of a Canvas layout container to their preferred width and preferred height. You may override the value for a child's preferred width by setting its width property to either a fixed pixel value or a percentage of the container size. You can set the preferred height in a similar manner.

If you use percentage sizing inside a Canvas container, some of your components may overlap. If this is not the effect you want, plan your component positions and sizes carefully.

Inheritance Hierarchy

```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
backgroundAlpha	the alpha level of the color defined by the backgroundColor property, of the image or SWF file defined by the backgroundImage style. Valid values range from 0.0 to 1.0. (Inherited from FlexContainer)
backgroundColor	the background color of a component. (Inherited from FlexContainer)
backgroundDisabledColor	the background color of the component when it is disabled. The global default value is undefined. (Inherited from FlexContainer)
backgroundImage	the background image of a component. This can be an absolute or relative URL or class. (Inherited from FlexContainer)
backgroundSize	the percentage to change the image size to for the specified backgroundImage. (Inherited from FlexContainer)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)

Name	Description
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>FlexContainer</i>)
<i>creationIndex</i>	the order to instantiate and draw the children of the container. (Inherited from <i>FlexContainer</i>)
<i>creationPolicy</i>	the child creation policy for this Container. (Inherited from <i>FlexContainer</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>fillAlphas</i>	the alpha transparency values used for the background fill of components. (Inherited from <i>FlexContainer</i>)
<i>fillColors</i>	the colors used to tint the background fill of the component. (Inherited from <i>FlexContainer</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexContainer</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use. (Inherited from <i>FlexContainer</i>)
<i>fontSize</i>	the height of the text, in pixels. (Inherited from <i>FlexContainer</i>)
<i>fontStyle</i>	whether the text is italic font. (Inherited from <i>FlexContainer</i>)
<i>fontWeight</i>	whether the text is boldface. (Inherited from <i>FlexContainer</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>label</i>	the text displayed by some navigator containers to represent this Container. (Inherited from <i>FlexContainer</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexContainer</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)

Name	Description
numChildren	the number of child components in this container. (Inherited from FlexContainer)
numColumns	the total number of columns of data available. (Inherited from FlexContainer)
numRows	the total number of rows of data available. (Inherited from FlexContainer)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from FlexObject)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from FlexObject)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from FlexObject)
scaleY	the number that specifies the vertical scaling factor. (Inherited from FlexObject)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from FlexDisplayObject)
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TestObject)
themeColor	the theme color of a component. (Inherited from FlexObject)
toolTip	the text to display in the ToolTip. The default value is Nothing. (Inherited from FlexObject)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from FlexObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from FlexContainer)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from FlexContainer)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from FlexContainer)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject . (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. The return value is an array of rows, each of which is an array of items. (Inherited from FlexContainer)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from FlexContainer)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Scroll	Dispatched when the user manually scrolls the container. (Inherited from FlexContainer)

Name	Description
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout

Name	Description
	specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexCartesianChart Class

Description

A base class for the common chart types. CartesianChart defines the basic layout behavior of the standard rectangular, two-dimensional charts.

Inheritance Hierarchy

- [FlexChart](#)
 - FlexCartesianChart
 - [FlexAreaChart](#)
 - [FlexBarChart](#)
 - [FlexBubbleChart](#)
 - [FlexCandlestickChart](#)
 - [FlexColumnChart](#)
 - [FlexHLOCChart](#)
 - [FlexLineChart](#)
 - [FlexPlotChart](#)

Syntax

```
'Declaration
Public Class FlexCartesianChart _
Inherits FlexChart
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)

Name	Description
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>clipContent</i>	whether Flex clips the chart to the area bounded by the axes. Set to false to clip the chart. Set to true to avoid clipping when the data is rendered. (Inherited from <i>FlexChart</i>)
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>FlexChart</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>dataTipMode</i>	how Flex displays DataTip controls for the chart. (Inherited from <i>FlexChart</i>)
<i>description</i>	a short description of the data in the chart. (Inherited from <i>FlexChart</i>)
<i>dragEnabled</i>	whether you can drag items out of this chart and drop them on other controls. (Inherited from <i>FlexChart</i>)
<i>dropEnabled</i>	whether dragged items can be dropped onto the chart. (Inherited from <i>FlexChart</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexChart</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use. (Inherited from <i>FlexChart</i>)
<i>fontSize</i>	the height of the text, in pixels. The default value is 10 for all controls except the ColorPicker control. For the ColorPicker control, the default value is 11. (Inherited from <i>FlexChart</i>)
<i>gutterBottom</i>	The size of the region, in pixels, between the bottom of the chart data area and the bottom of the chart control.
<i>gutterLeft</i>	The size of the region, in pixels, between the left of the chart data area and the left of the chart control.
<i>gutterRight</i>	The size of the region, in pixels, between the right side of the chart data area and the outside of the chart control.
<i>gutterTop</i>	The size of the region, in pixels, between the top of the chart data area and the top of the chart control.
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>horizontalAxisRatio</i>	the height limit of the horizontal axis.

Name	Description
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexChart</i>)
<i>maximumDataTipCount</i>	the maximum number of datatips a chart will show. (Inherited from <i>FlexChart</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>mouseSensitivity</i>	the distance, in pixels, that Flex considers a data point to be under the mouse pointer when the pointer moves around a chart. (Inherited from <i>FlexChart</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>FlexChart</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>FlexChart</i>)
<i>paddingBottom</i>	the number of pixels between the chart's bottom border and its content area. (Inherited from <i>FlexChart</i>)
<i>paddingLeft</i>	the number of pixels between the control's left border and the left edge of its content area. The default value is 2. (Inherited from <i>FlexChart</i>)
<i>paddingRight</i>	the number of pixels between the control's right border and the right edge of its content area. The default value is 0. (Inherited from <i>FlexChart</i>)
<i>paddingTop</i>	the number of pixels between the chart's top border and its content area. (Inherited from <i>FlexChart</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectedChartItem</i>	the selected ChartItem in the chart. If multiple items are selected, this property specifies the most recently selected item. (Inherited from <i>FlexChart</i>)

Name	Description
<i>selectedChartItems</i>	an array of all the selected ChartItem objects in the chart. (Inherited from <i>FlexChart</i>)
<i>selectionMode</i>	whether ChartItem objects can be selected. (Inherited from <i>FlexChart</i>)
<i>showDataTips</i>	whether DataTip controls for the chart show. (Inherited from <i>FlexChart</i>)
<i>showDataTipTargets</i>	whether to show targets over the datapoints when showDataTips is set to true. (Inherited from <i>FlexChart</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TextObject</i>)
<i>textAlign</i>	the alignment of text within a container.
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TextObject</i>)
<i>verticalAxisRatio</i>	the width limit of the vertical axis.
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored

Name	Description
	in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from FlexChart)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from FlexChart)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from FlexChart)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)

Name	Description
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from FlexChart)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Select	Defines the value of the type property of the event object for a headerRelease event, which indicates that the user pressed and released the mouse on a column header. (Inherited from FlexChart)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)

Name	Description
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If

Name	Description
	you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexChart Class

Description

The link between the Flex component architecture and the DualStyleObject architecture. It extends the Flex UIComponent base class, but contains DualStyleObject classes.

You typically do not use the ChartBase class directly. Instead you use one of its subclasses, such as PlotChart or BubbleChart. It acts as the base class for the common chart types provided in the mx.charts package.

This class defines a number of CSS styles and properties that provide easy access to the more common features of the framework.

A chart's minimum size is 20 x 20 pixels. A chart's maximum size is unbounded. A chart's preferred size is 400 x 400 pixels.

Inheritance Hierarchy

- [FlexObject](#)
 - FlexChart
 - [FlexCartesianChart](#)
 - [FlexPieChart](#)

Syntax

```
'Declaration
Public Class FlexChart _
Inherits FlexObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)

Name	Description
<i>clipContent</i>	whether Flex clips the chart to the area bounded by the axes. Set to false to clip the chart. Set to true to avoid clipping when the data is rendered.
<i>columnNames</i>	a list containing the names of all columns in the data.
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>dataTipMode</i>	how Flex displays DataTip controls for the chart.
<i>description</i>	a short description of the data in the chart.
<i>dragEnabled</i>	whether you can drag items out of this chart and drop them on other controls.
<i>dropEnabled</i>	whether dragged items can be dropped onto the chart.
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child.
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use.
<i>fontSize</i>	the height of the text, in pixels. The default value is 10 for all controls except the ColorPicker control. For the ColorPicker control, the default value is 11.
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>lastVisibleRow</i>	the index of the last visible child.
<i>maximumDataTipCount</i>	the maximum number of datatips a chart will show.
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>mouseSensitivity</i>	the distance, in pixels, that Flex considers a data point to be under the mouse pointer when the pointer moves around a chart.
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)

Name	Description
<i>numColumns</i>	the total number of columns in the data available.
<i>numRows</i>	the total number of rows of data available.
<i>paddingBottom</i>	the number of pixels between the chart's bottom border and its content area.
<i>paddingLeft</i>	the number of pixels between the control's left border and the left edge of its content area. The default value is 2.
<i>paddingRight</i>	the number of pixels between the control's right border and the right edge of its content area. The default value is 0.
<i>paddingTop</i>	the number of pixels between the chart's top border and its content area.
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or <i>explicitWidth</i> properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectedChartItem</i>	the selected ChartItem in the chart. If multiple items are selected, this property specifies the most recently selected item.
<i>selectedChartItems</i>	an array of all the selected ChartItem objects in the chart.
<i>selectionMode</i>	whether ChartItem objects can be selected.
<i>showDataTips</i>	whether DataTip controls for the chart show.
<i>showDataTipTargets</i>	whether to show targets over the datapoints when <i>showDataTips</i> is set to true.
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TextObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is <i>Nothing</i> . (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <i>useHandCursor</i> is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)

Name	Description
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Defines the value of the type property of the event object for a dragComplete event.
DragDrop	Defines the value of the type property of the event object for a dragDrop event.
DragStart	Defines the value of the type property of the event object for a dragStart event.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)

Name	Description
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components.
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)

Name	Description
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Select	Defines the value of the type property of the event object for a headerRelease event, which indicates that the user pressed and released the mouse on a column header.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by

Name	Description
	setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexChartLegend Class

Description

Adds a legend to your charts, where the legend displays the label for each data series in the chart and a key showing the chart element for the series.

Inheritance Hierarchy

- [FlexObject](#)
 - FlexChartLegend

Syntax

```
'Declaration
Public Class FlexChartLegend _
Inherits FlexObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)

Name	Description
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i>)
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>columnNames</i>	a list containing the names of all columns in the data.
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child.
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontWeight</i>	whether the text is boldface.
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>label</i>	the text that displays next to the legend element.
<i>labelPlacement</i>	the label placement of the legend element. Valid values include: <i>top</i> , <i>bottom</i> , <i>right</i> , and <i>left</i> .
<i>lastVisibleRow</i>	the index of the last visible child.
<i>markerAspectRatio</i>	the aspect ratio for the marker associated with this legend item.
<i>markerHeight</i>	the height of the legend element.
<i>markerWidth</i>	the width of the legend element.
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any <i>InteractiveObject</i> instance that is on the display list receives mouse events. If <i>mouseEnabled</i> is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the <i>mouseEnabled</i> behavior for all children of an object on the display list, use <i>flash.display.DisplayObjectContainer.mouseChildren</i> . (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)

Name	Description
<i>numColumns</i>	the total number of columns in the data available.
<i>numRows</i>	the total number of rows of data available.
<i>paddingLeft</i>	the number of pixels between the control's left border and the left edge of its content area. The default value is 2.
<i>paddingRight</i>	the number of pixels between the control's right border and the right edge of its content area. The default value is 0.
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or <i>explicitWidth</i> properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is <i>Nothing</i> . (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <i>useHandCursor</i> is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>verticalGap</i>	the number of pixels between children in the vertical direction. The default value depends on the component class; if not overridden for the class, the default value is 6.
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Name	Description
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components.
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
LegendItemClick	Dispatched when the user clicks on a LegendItem in the Legend control, which indicates that the user clicked the mouse button over a legend item.
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)

Name	Description
 SetProperty 	Sets the value of the specified property. (Inherited from TestObject)
 TextCapture 	Returns the text in this object's visible area. (Inherited from TestObject)
 TextClick 	Clicks in the center of the specified text. (Inherited from TestObject)
 TextExists 	Returns whether the specified text exists. (Inherited from TestObject)
 TextRectangle 	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
 ToString 	Returns a string representation of the control. (Inherited from FlexDisplayObject)
 TypeKeys 	Sends a set of keystrokes to the object. (Inherited from IKeyable)
 TypePasswordKeys 	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
 WaitForChildDisappearance 	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForDisappearance 	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForObject 	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
 WaitForProperty 	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForPropertyNotEquals 	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexChartSeries Class

Description

The base class for the classes that let you specify a data series for a chart control.

You use the subclasses of the Series class with the associated chart control. You can use a Series class to specify the fill pattern and stroke characteristics for the chart elements that are associated with the data series.

Inheritance Hierarchy

- [FlexObject](#)
 - FlexChartSeries
 - [FlexAreaSeries](#)
 - [FlexBarSeries](#)
 - [FlexBubbleSeries](#)
 - [FlexColumnSeries](#)
 - [FlexHLOCSeriesBase](#)
 - [FlexLineSeries](#)
 - [FlexPieSeries](#)
 - [FlexPlotSeries](#)

Syntax

```
'Declaration
Public Class FlexChartSeries _
Inherits FlexObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)

Name	Description
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>columnNames</i>	a list containing the names of all columns in the data.
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child.
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>lastVisibleRow</i>	the index of the last visible child.
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any <i>InteractiveObject</i> instance that is on the display list receives mouse events. If <i>mouseEnabled</i> is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the <i>mouseEnabled</i> behavior for all children of an object on the display list, use <code>flash.display.DisplayObjectContainer.mouseChildren</code> . (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available.
<i>numRows</i>	the total number of rows of data available.
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or <i>explicitWidth</i> properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectedIndex</i>	the index of the selected item in the data provider of the series.

Name	Description
<i>selectedIndices</i>	an array of indexes of the selected items in the data provider of the series.
<i>selectedItem</i>	the chart item that is selected in the series.
<i>selectedItems</i>	an array of chart items that are selected in the series.
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>ChangeFocus</i>	Changes the current focus. (Inherited from <i>FlexObject</i>)
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i>)

Name	Description
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components.
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)

Name	Description
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SeriesClick	Indicates that the user clicked the mouse button over a chart item representing data in the chart.
SeriesDoubleClick	Indicates that the user double-clicked the mouse button over a chart item representing data in the chart.
SeriesItemRollOver	Indicates that the user rolled the mouse pointer over a chart item representing data in the chart.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)

Name	Description
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexCheckBox Class

Description

The `CheckBox` control consists of an optional label and a small box that can contain a check mark or not.

You can place the optional text label to the left, right, top, or bottom of the `CheckBox`. When a user clicks a `CheckBox` control or its associated text, the `CheckBox` control changes its state from checked to

unchecked or from unchecked to checked. CheckBox controls gather a set of true or false values that are not mutually exclusive.

Inheritance Hierarchy

- *FlexButton*
 - FlexCheckBox

Syntax

```
'Declaration

```

Properties

Name	Description
<i>alpha</i>	the alpha transparency value of the object specified. (Inherited from <i>FlexDisplayObject</i>)
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i>)
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>color</i>	the color of text in the component, including the component label. The default value is 0x0B333C. (Inherited from <i>FlexButton</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>disabledColor</i>	the color of text in the component if it is disabled. The default value is 0xAAB3B3. (Inherited from <i>FlexButton</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>fillAlphas</i>	the alphas used for the background fill of controls. (Inherited from <i>FlexButton</i>)
<i>fillColors</i>	the colors used to tint the background of the control. (Inherited from <i>FlexButton</i>)
<i>focusAlpha</i>	the alpha transparency value of the focus skin. The default value is 0.4. (Inherited from <i>FlexButton</i>)

Name	Description
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use. (Inherited from <i>FlexButton</i>)
<i>fontSize</i>	the height of the text, in pixels. (Inherited from <i>FlexButton</i>)
<i>fontStyle</i>	whether the text is italic font. (Inherited from <i>FlexButton</i>)
<i>fontWeight</i>	whether the text is boldface. (Inherited from <i>FlexButton</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>label</i>	the text to appear on the Button control. (Inherited from <i>FlexButton</i>)
<i>labelPlacement</i>	the orientation of the label in relation to a specified icon. (Inherited from <i>FlexButton</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selected</i>	whether a toggle button is toggled on (true) or off (false). (Inherited from <i>FlexButton</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TextObject</i>)

Name	Description
textAlign	the alignment of text within a container. (Inherited from FlexButton)
textDecoration	whether the text is underlined. (Inherited from FlexButton)
textIndent	the offset of the first line of text from the left side of the container, in pixels. The default value is 0. (Inherited from FlexButton)
textRollOverColor	the text color of the label as the user moves the mouse pointer over the button. The default value is 0x2B333C. (Inherited from FlexButton)
textSelectedColor	the text color of the label as the user presses it. The default value is 0x000000. (Inherited from FlexButton)
themeColor	the theme color of a component. (Inherited from FlexObject)
toggle	whether a Button is in a toggle state or not. (Inherited from FlexButton)
toolTip	the text to display in the ToolTip. The default value is Nothing. (Inherited from FlexObject)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from FlexObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)

Name	Description
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)

Name	Description
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key. (Inherited from FlexButton)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
<i>WaitForDisappearance</i>	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>) Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <i>OPT_WAIT_RESOLVE_OBJDEF</i> . Use <i>WaitForObject</i> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <i>WaitForObject</i> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <i>WaitForObject</i> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

FlexColorPicker Class

Description

Provides a way for a user to choose a color from a swatch list.

The default mode of the component shows a single swatch in a square button. When the user clicks the swatch button, the swatch panel appears and displays the entire swatch list.

Inheritance Hierarchy

- [*FlexComboBase*](#)
 - FlexColorPicker

Syntax

```
'Declaration  
Public Class FlexColorPicker _  
Inherits FlexComboBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
backgroundAlpha	the alpha level of the color defined by the backgroundColor property, of the image or SWF file defined by the backgroundImage style. (Inherited from FlexComboBase)
backgroundColor	the background color of a component. (Inherited from FlexComboBase)
backgroundImage	the background image of a component. (Inherited from FlexComboBase)
backgroundSize	the percentage to change the image size to for the specified backgroundImage. (Inherited from FlexComboBase)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
color	the color of text in the component, including the component label. (Inherited from FlexComboBase)
columnCount	the number of columns in the swatch grid. The default value is 20.
currentState	the current view state of the component. (Inherited from FlexObject)
disabledColor	the background color of the component when it is disabled. (Inherited from FlexComboBase)
dropShadowEnabled	whether the ComboBase container's drop shadow is visible. The default value is true. (Inherited from FlexComboBase)
editable	whether the control is editable, which lets the user directly type entries that are not specified in the dataProvider, or not editable, which requires the user select from the items in the dataProvider. (Inherited from FlexComboBase)
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)

Name	Description
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>fillAlphas</i>	the alphas used for the background fill of controls. (Inherited from <i>FlexComboBase</i>)
<i>fillColors</i>	the colors used to tint the background of the control. (Inherited from <i>FlexComboBase</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use. (Inherited from <i>FlexComboBase</i>)
<i>fontSize</i>	the height of the text, in pixels. (Inherited from <i>FlexComboBase</i>)
<i>fontStyle</i>	whether the text is italic font. (Inherited from <i>FlexComboBase</i>)
<i>fontWeight</i>	whether the text is boldface. (Inherited from <i>FlexComboBase</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>highlightColor</i>	the highlight color of the drop-down list. (Inherited from <i>FlexComboBase</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>restrict</i>	the set of characters that a user can or cannot enter into the text field. (Inherited from <i>FlexComboBase</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectedColor</i>	the value of the currently selected color in the SwatchPanel object.
<i>selectedIndex</i>	the index in the data provider of the selected item. (Inherited from <i>FlexComboBase</i>)

Name	Description
showTextField	whether to show the text box that displays the color label or hexadecimal color value. The default value is true.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from FlexDisplayObject)
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TestObject)
text	the contents of the text field. (Inherited from FlexComboBase)
textAlign	the alignment of text within a container. Possible values are:left, right, or center. (Inherited from FlexComboBase)
textDecoration	whether the text is underlined. (Inherited from FlexComboBase)
textIndent	the offset of first line of text from the left side of the container, in pixels. The default value is 0. (Inherited from FlexComboBase)
themeColor	the theme color of a component. (Inherited from FlexObject)
toolTip	the text to display in the ToolTip. The default value is Nothing. (Inherited from FlexObject)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from FlexObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant

Name	Description
	<i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
Change	Dispatched when the selected color changes as a result of user interaction.
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
Close	Defines the value of the type property of the event object for a close event. (Inherited from FlexComboBase)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)

Name	Description
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Input</i>	Creates an Event object that contains information about text events. Event objects are passed as parameters to event listeners. (Inherited from <i>FlexComboBase</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <i>TestObject</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>Move</i>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <i>FlexObject</i>)
<i>Open</i>	Defines the value of the type property of the event object for an open event. (Inherited from <i>FlexComboBase</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>Scroll</i>	Defines the value of the type property of the event object for a scroll event. (Inherited from <i>FlexComboBase</i>)
<i>SelectText</i>	Lets you track selection within a text field. (Inherited from <i>FlexComboBase</i>)
<i>SetFocus</i>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <i>FlexObject</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)

Name	Description
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key. (Inherited from FlexComboBase)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexColumnChart Class

Description

Represents data as a series of vertical columns whose height is determined by values in the data.

You can use the ColumnChart to represent a variety of different charts including simple columns, clustered columns, stacked, 100% stacked, and high/low.

Inheritance Hierarchy

- [FlexCartesianChart](#)
 - FlexColumnChart

Syntax

```
'Declaration
Public Class FlexColumnChart _
Inherits FlexCartesianChart
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
clipContent	whether Flex clips the chart to the area bounded by the axes. Set to false to clip the chart. Set to true to avoid clipping when the data is rendered. (Inherited from FlexChart)
columnNames	a list containing the names of all columns in the data. (Inherited from FlexChart)
columnWidthRatio	a ratio of wide to draw the columns relative to the category width, as a percentage in the range of 0 to 1.
currentState	the current view state of the component. (Inherited from FlexObject)
dataTipMode	how Flex displays DataTip controls for the chart. (Inherited from FlexChart)

Name	Description
<i>description</i>	a short description of the data in the chart. (Inherited from <i>FlexChart</i>)
<i>dragEnabled</i>	whether you can drag items out of this chart and drop them on other controls. (Inherited from <i>FlexChart</i>)
<i>dropEnabled</i>	whether dragged items can be dropped onto the chart. (Inherited from <i>FlexChart</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexChart</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use. (Inherited from <i>FlexChart</i>)
<i>fontSize</i>	the height of the text, in pixels. The default value is 10 for all controls except the ColorPicker control. For the ColorPicker control, the default value is 11. (Inherited from <i>FlexChart</i>)
<i>gutterBottom</i>	The size of the region, in pixels, between the bottom of the chart data area and the bottom of the chart control. (Inherited from <i>FlexCartesianChart</i>)
<i>gutterLeft</i>	The size of the region, in pixels, between the left of the chart data area and the left of the chart control. (Inherited from <i>FlexCartesianChart</i>)
<i>gutterRight</i>	The size of the region, in pixels, between the right side of the chart data area and the outside of the chart control. (Inherited from <i>FlexCartesianChart</i>)
<i>gutterTop</i>	The size of the region, in pixels, between the top of the chart data area and the top of the chart control. (Inherited from <i>FlexCartesianChart</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>horizontalAxisRatio</i>	the height limit of the horizontal axis. (Inherited from <i>FlexCartesianChart</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexChart</i>)
<i>maxColumnWidth</i>	how wide to draw the columns, in pixels.
<i>maximumDataTipCount</i>	the maximum number of datatips a chart will show. (Inherited from <i>FlexChart</i>)

Name	Description
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>mouseSensitivity</i>	the distance, in pixels, that Flex considers a data point to be under the mouse pointer when the pointer moves around a chart. (Inherited from <i>FlexChart</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>FlexChart</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>FlexChart</i>)
<i>paddingBottom</i>	the number of pixels between the chart's bottom border and its content area. (Inherited from <i>FlexChart</i>)
<i>paddingLeft</i>	the number of pixels between the control's left border and the left edge of its content area. The default value is 2. (Inherited from <i>FlexChart</i>)
<i>paddingRight</i>	the number of pixels between the control's right border and the right edge of its content area. The default value is 0. (Inherited from <i>FlexChart</i>)
<i>paddingTop</i>	the number of pixels between the chart's top border and its content area. (Inherited from <i>FlexChart</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectedChartItem</i>	the selected ChartItem in the chart. If multiple items are selected, this property specifies the most recently selected item. (Inherited from <i>FlexChart</i>)
<i>selectedChartItems</i>	an array of all the selected ChartItem objects in the chart. (Inherited from <i>FlexChart</i>)
<i>selectionMode</i>	whether ChartItem objects can be selected. (Inherited from <i>FlexChart</i>)

Name	Description
<i>showDataTips</i>	whether DataTip controls for the chart show. (Inherited from <i>FlexChart</i>)
<i>showDataTipTargets</i>	whether to show targets over the datapoints when showDataTips is set to true. (Inherited from <i>FlexChart</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>textAlign</i>	the alignment of text within a container. (Inherited from <i>FlexCartesianChart</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>verticalAxisRatio</i>	the width limit of the vertical axis. (Inherited from <i>FlexCartesianChart</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant

Name	Description
	<i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from FlexChart)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from FlexChart)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from FlexChart)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from FlexChart)

Name	Description
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject . (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Select	Defines the value of the type property of the event object for a headerRelease event, which indicates that the user pressed and released the mouse on a column header. (Inherited from FlexChart)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)

Name	Description
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexColumnSeries Class

Description

Defines a data series for a ColumnChart control.

Inheritance Hierarchy

- [FlexChartSeries](#)
 - FlexColumnSeries

Syntax

```
'Declaration
Public Class FlexColumnSeries _
Inherits FlexChartSeries
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
columnNames	a list containing the names of all columns in the data. (Inherited from FlexChartSeries)
columnWidthRatio	the width of columns relative to the category width.
currentState	the current view state of the component. (Inherited from FlexObject)
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from FlexObject)
firstVisibleRow	the index of the first visible child. (Inherited from FlexChartSeries)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from FlexObject)

Name	Description
height	the height of the display object, in pixels. (Inherited from FlexDisplayObject)
id	the ID of the component. (Inherited from FlexObject)
lastVisibleRow	the index of the last visible child. (Inherited from FlexChartSeries)
maxColumnWidth	the width of the columns, in pixels.
minField	the field of the data provider that determines the y-axis location of the bottom of a column.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from FlexDisplayObject)
numAutomationChildren	the number of automation children this container has. (Inherited from FlexObject)
numColumns	the total number of columns in the data available. (Inherited from FlexChartSeries)
numRows	the total number of rows of data available. (Inherited from FlexChartSeries)
offset	how far to offset the center of the columns from the center of the available space, relative to the category width.
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from FlexObject)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from FlexObject)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from FlexObject)
scaleY	the number that specifies the vertical scaling factor. (Inherited from FlexObject)
selectedIndex	the index of the selected item in the data provider of the series. (Inherited from FlexChartSeries)
selectedIndices	an array of indexes of the selected items in the data provider of the series. (Inherited from FlexChartSeries)
selectedItem	the chart item that is selected in the series. (Inherited from FlexChartSeries)
selectedItems	an array of chart items that are selected in the series. (Inherited from FlexChartSeries)
sortOnXField	whether the columns are sorted from left to right before rendering.

Name	Description
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>xField</i>	the field of the data provider that determines the x-axis location of the column.
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>yField</i>	the field of the data provider that determines the y-axis location of the top of a column.

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>ChangeFocus</i>	Changes the current focus. (Inherited from <i>FlexObject</i>)
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i>)

Name	Description
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from FlexChartSeries)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)

Name	Description
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SeriesClick	Indicates that the user clicked the mouse button over a chart item representing data in the chart. (Inherited from FlexChartSeries)
SeriesDoubleClick	Indicates that the user double-clicked the mouse button over a chart item representing data in the chart. (Inherited from FlexChartSeries)
SeriesItemRollOver	Indicates that the user rolled the mouse pointer over a chart item representing data in the chart. (Inherited from FlexChartSeries)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)

Name	Description
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexComboBase Class

Description

The base class for controls that display text in a text field and have a button that causes a drop-down list to appear where the user can choose which text to display.

Inheritance Hierarchy

- *FlexObject*
 - FlexComboBase
 - *FlexColorPicker*
 - *FlexComboBox*
 - *FlexDateField*

Syntax

```
'Declaration  
Public Class FlexComboBase _  
Inherits FlexObject
```

Properties

Name	Description
<i>alpha</i>	the alpha transparency value of the object specified. (Inherited from <i>FlexDisplayObject</i>)
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i>)
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>backgroundAlpha</i>	the alpha level of the color defined by the <i>backgroundColor</i> property, of the image or SWF file defined by the <i>backgroundImage</i> style.
<i>backgroundColor</i>	the background color of a component.
<i>backgroundImage</i>	the background image of a component.
<i>backgroundSize</i>	the percentage to change the image size to for the specified <i>backgroundImage</i> .
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>color</i>	the color of text in the component, including the component label.
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>disabledColor</i>	the background color of the component when it is disabled.
<i>dropShadowEnabled</i>	whether the ComboBase container's drop shadow is visible. The default value is true.
<i>editable</i>	whether the control is editable, which lets the user directly type entries that are not specified in the <i>dataProvider</i> , or not editable, which requires the user select from the items in the <i>dataProvider</i> .
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)

Name	Description
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>fillAlphas</i>	the alphas used for the background fill of controls.
<i>fillColors</i>	the colors used to tint the background of the control.
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use.
<i>fontSize</i>	the height of the text, in pixels.
<i>fontStyle</i>	whether the text is italic font.
<i>fontWeight</i>	whether the text is boldface.
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>highlightColor</i>	the highlight color of the drop-down list.
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>restrict</i>	the set of characters that a user can or cannot enter into the text field.
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectedIndex</i>	the index in the data provider of the selected item.
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)

Name	Description
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>text</i>	the contents of the text field.
<i>textAlign</i>	the alignment of text within a container. Possible values are:left, right, or center.
<i>textDecoration</i>	whether the text is underlined.
<i>textIndent</i>	the offset of first line of text from the left side of the container, in pixels. The default value is 0.
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>ChangeFocus</i>	Changes the current focus. (Inherited from <i>FlexObject</i>)
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i>)
<i>Close</i>	Defines the value of the type property of the event object for a close event.

Name	Description
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)

Name	Description
Input	Creates an Event object that contains information about text events. Event objects are passed as parameters to event listeners.
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
Open	Defines the value of the type property of the event object for a open event.
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Scroll	Defines the value of the type property of the event object for a scroll event.
SelectText	Lets you track selection within a text field.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)

Name	Description
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

FlexComboBox Class

Description

Contains a drop-down list from which the user can select a single value.

The `ComboBox` can be editable, in which case the user can type entries into the `TextInput` portion of the `ComboBox` that are not in the list.

Inheritance Hierarchy

- [FlexComboBase](#)
 - FlexComboBox

Syntax

```
'Declaration  
Public Class FlexComboBox _  
Inherits FlexComboBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
alternatingItemColors	the set of BackgroundColors for drop-down list rows in an alternating pattern.
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
backgroundAlpha	the alpha level of the color defined by the backgroundColor property, of the image or SWF file defined by the backgroundImage style. (Inherited from FlexComboBase)
backgroundColor	the background color of a component. (Inherited from FlexComboBase)
backgroundImage	the background image of a component. (Inherited from FlexComboBase)
backgroundSize	the percentage to change the image size to for the specified backgroundImage. (Inherited from FlexComboBase)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
color	the color of text in the component, including the component label. (Inherited from FlexComboBase)
columnNames	a list containing the names of all columns in the data.
currentState	the current view state of the component. (Inherited from FlexObject)
disabledColor	the background color of the component when it is disabled. (Inherited from FlexComboBase)
dropShadowEnabled	whether the ComboBase container's drop shadow is visible. The default value is true. (Inherited from FlexComboBase)
editable	whether the control is editable, which lets the user directly type entries that are not specified in the dataProvider, or not editable, which

Name	Description
	requires the user select from the items in the dataProvider. (Inherited from <i>FlexComboBase</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>fillAlphas</i>	the alphas used for the background fill of controls. (Inherited from <i>FlexComboBase</i>)
<i>fillColors</i>	the colors used to tint the background of the control. (Inherited from <i>FlexComboBase</i>)
<i>firstVisibleRow</i>	the index of the first visible child.
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use. (Inherited from <i>FlexComboBase</i>)
<i>fontSize</i>	the height of the text, in pixels. (Inherited from <i>FlexComboBase</i>)
<i>fontStyle</i>	whether the text is italic font. (Inherited from <i>FlexComboBase</i>)
<i>fontWeight</i>	whether the text is boldface. (Inherited from <i>FlexComboBase</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>highlightColor</i>	the highlight color of the drop-down list. (Inherited from <i>FlexComboBase</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>lastVisibleRow</i>	the index of the last visible child.
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available.
<i>numRows</i>	the total number of rows of data available.
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is

Name	Description
	NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>restrict</i>	the set of characters that a user can or cannot enter into the text field. (Inherited from <i>FlexComboBase</i>)
<i>rollOverColor</i>	the rollOverColor of the drop-down list.
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectedIndex</i>	the index in the data provider of the selected item. (Inherited from <i>FlexComboBase</i>)
<i>selectionColor</i>	the selectionColor of the drop-down list.
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>text</i>	the contents of the text field. (Inherited from <i>FlexComboBase</i>)
<i>textAlign</i>	the alignment of text within a container. Possible values are:left, right, or center. (Inherited from <i>FlexComboBase</i>)
<i>textDecoration</i>	whether the text is underlined. (Inherited from <i>FlexComboBase</i>)
<i>textIndent</i>	the offset of first line of text from the left side of the container, in pixels. The default value is 0. (Inherited from <i>FlexComboBase</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Name	Description
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
Close	Defines the value of the type property of the event object for a close event. (Inherited from FlexComboBase)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components.
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Input	Creates an Event object that contains information about text events. Event objects are passed as parameters to event listeners. (Inherited from FlexComboBase)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
Open	Defines the value of the type property of the event object for a open event. (Inherited from FlexComboBase)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)

Name	Description
Scroll	Defines the value of the type property of the event object for a scroll event. (Inherited from FlexComboBase)
Select	Defines the value of the type property of the event object for an event that is dispatched when a single item is selected.
SelectIndex	Defines the value of the type property of the event object for an event that is dispatched when a single item is selected.
SelectText	Lets you track selection within a text field. (Inherited from FlexComboBase)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key. (Inherited from FlexComboBase)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive

Name	Description
<i>WaitForObject</i>	random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

FlexContainer Class

Description

An abstract base class for components that controls the layout characteristics of child components.

You do not create an instance of `Container` in an application. Instead, you create an instance of one of `Container`'s subclasses, such as `Canvas` or `HBox`.

The `Container` class contains the logic for scrolling, clipping, and dynamic instantiation. It contains methods for adding and removing children and the logic for drawing the background and borders of containers.

Inheritance Hierarchy

- *FlexObject*
 - `FlexContainer`
 - *FlexAccordion*
 - *FlexApplication*
 - *FlexBox*
 - *FlexCanvas*
 - *FlexForm*
 - *FlexFormItem*
 - *FlexPanel*
 - *FlexViewStack*
 - *FlexWindow*

Syntax

```
'Declaration
Public Class FlexContainer _
Inherits FlexObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
backgroundAlpha	the alpha level of the color defined by the backgroundColor property, of the image or SWF file defined by the backgroundImage style. Valid values range from 0.0 to 1.0.
backgroundColor	the background color of a component.
backgroundDisabledColor	the background color of the component when it is disabled. The global default value is undefined.
backgroundImage	the background image of a component. This can be an absolute or relative URL or class.
backgroundSize	the percentage to change the image size to for the specified backgroundImage .
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
columnNames	a list containing the names of all columns in the data.
creationIndex	the order to instantiate and draw the children of the container.
creationPolicy	the child creation policy for this Container.
currentState	the current view state of the component. (Inherited from FlexObject)
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from FlexObject)
fillAlphas	the alpha transparency values used for the background fill of components.
fillColors	the colors used to tint the background fill of the component.
firstVisibleRow	the index of the first visible child.

Name	Description
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use.
<i>fontSize</i>	the height of the text, in pixels.
<i>fontStyle</i>	whether the text is italic font.
<i>fontWeight</i>	whether the text is boldface.
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>label</i>	the text displayed by some navigator containers to represent this Container.
<i>lastVisibleRow</i>	the index of the last visible child.
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numChildren</i>	the number of child components in this container.
<i>numColumns</i>	the total number of columns of data available.
<i>numRows</i>	the total number of rows of data available.
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)

Name	Description
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is <i>Nothing</i> . (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <i>useHandCursor</i> is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the <i>DisplayObject</i> instance relative to the local coordinates of the parent <i>DisplayObjectContainer</i> . (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the <i>DisplayObject</i> instance relative to the local coordinates of the parent <i>DisplayObjectContainer</i> . (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>ChangeFocus</i>	Changes the current focus. (Inherited from <i>FlexObject</i>)
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i>)
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i>)
<i>DragCancel</i>	Defines the value of the type property of the event object for a <i>dragComplete</i> event.
<i>DragDrop</i>	Defines the value of the type property of the event object for a <i>dragDrop</i> event.
<i>DragStart</i>	Defines the value of the type property of the event object for a <i>dragStart</i> event.
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is

Name	Description
	specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>GetStyle</i>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <i>FlexDisplayObject</i>)
<i>GetValues</i>	Returns a matrix containing the automation values of all parts of the components. The return value is an array of rows, each of which is an array of items.
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)

Name	Description
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance.
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Scroll	Dispatched when the user manually scrolls the container.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout

Name	Description
WaitForObject	parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject) Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexContainerMovieClip Class

Description

Container components created in Adobe Flash CS3 Professional for use in Flex are subclasses of the `mx.flash.ContainerMovieClip` class.

You can use a subclass of `ContainerMovieClip` as a Flex container, it can hold children, and it can respond to events, define view states and transitions, and work with effects in the same way as can any Flex component.

A Flash container can only have a single Flex child. However, this child can be a Flex container which allows you to add additional children.

Inheritance Hierarchy

- [FlexUIMovieClip](#)
 - `FlexContainerMovieClip`

Syntax

```
'Declaration  
Public Class FlexContainerMovieClip _  
Inherits FlexUIMovieClip
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexUIMovieClip)
automationIndex	a string containing the automation index for the element. (Inherited from FlexUIMovieClip)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexUIMovieClip)
className	the name of this instance's class, such as "Button". (Inherited from FlexUIMovieClip)
currentState	the current state of this component. (Inherited from FlexUIMovieClip)
enabled	whether a movie clip is enabled. (Inherited from FlexUIMovieClip)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexUIMovieClip)
errorString	the text that is displayed by a component's error tip when a component is monitored and validation fails. (Inherited from FlexUIMovieClip)
focusEnabled	whether the component can receive focus when selected. (Inherited from FlexUIMovieClip)
height	the height of the display object, in pixels. (Inherited from FlexDisplayObject)
id	the ID of the component. (Inherited from FlexUIMovieClip)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from FlexDisplayObject)
numAutomationChildren	the number of automation children this container has. (Inherited from FlexUIMovieClip)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. Valid values are 0 to 100. (Inherited from FlexUIMovieClip)

Name	Description
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Valid values are 0 to 100. (Inherited from FlexUIMovieClip)
scaleX	the horizontal scale (percentage) of the object as applied from the registration point. The default registration point is (0,0). 1.0 equals 100% scale. (Inherited from FlexUIMovieClip)
scaleY	the vertical scale (percentage) of an object as applied from the registration point of the object. The default registration point is (0,0). 1.0 is 100% scale. (Inherited from FlexUIMovieClip)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from FlexDisplayObject)
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TestObject)
themeColor	the theme color of a component. (Inherited from FlexUIMovieClip)
toolTip	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from FlexUIMovieClip)
useHandCursor	whether the pointing hand (hand cursor) appears when the mouse rolls over a sprite in which the <code>buttonMode</code> property is set to true. (Inherited from FlexUIMovieClip)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from FlexDisplayObject)
y	the y coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding.

Name	Description
	In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Defines the value of the type property of a keyFocusChange event object. (Inherited from FlexUIMovieClip)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragDrop	Defines the value of the type property of the event object for a dragDrop event.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)

Name	Description
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>SetFocus</i>	Called by the FocusManager when the component receives focus. The component may in turn set focus to an internal component. (Inherited from <i>FlexUIMovieClip</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>ToString</i>	Returns a string representation of the control. (Inherited from <i>FlexDisplayObject</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)

Name	Description
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexDataGrid Class

Description

The `DataGrid` control is like a `List` except that it can show more than one column of data making it suited for showing objects with multiple properties.

Inheritance Hierarchy

- [FlexListBase](#)

- FlexDataGrid

Syntax

```
'Declaration
Public Class FlexDataGrid _
Inherits FlexListBase
```

Properties

Name	Description
<i>allowMultipleSelection</i>	whether you can allow more than one item to be selected at the same time. (Inherited from <i>FlexListBase</i>)
<i>alpha</i>	the alpha transparency value of the object specified. (Inherited from <i>FlexDisplayObject</i>)
<i>alternatingItemColors</i>	the colors to use for the backgrounds of the items in the list. (Inherited from <i>FlexListBase</i>)
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i>)
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>backgroundDisabledColor</i>	the color of text in the component if it is disabled. The default value is 0xAAB3B3. (Inherited from <i>FlexListBase</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>columnCount</i>	the number of columns to be displayed in a <i>TileList</i> control or items in a <i>HorizontalList</i> control. (Inherited from <i>FlexListBase</i>)
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>FlexListBase</i>)
<i>columnWidth</i>	the width of the control's columns. (Inherited from <i>FlexListBase</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>dataTipField</i>	the name of the field in the data provider items to display as the data tip. (Inherited from <i>FlexListBase</i>)
<i>editable</i>	whether the user can edit items in the data provider.
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexListBase</i>)

Name	Description
<i>focusAlpha</i>	the alpha transparency value of the focus skin. The default value is 0.4. (Inherited from <i>FlexListBase</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>headerColors</i>	An array of two colors used to draw the header background gradient.
<i>headerStyleName</i>	the name of a CSS style declaration for controlling other aspects of the appearance of the column headers. The default value is <i>dataGridStyles</i> .
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>horizontalGridLineColor</i>	the color of the horizontal grid lines.
<i>horizontalGridLines</i>	whether to show horizontal grid lines between the rows.
<i>iconField</i>	the name of the field in the data provider object that determines what to display as the icon. (Inherited from <i>FlexListBase</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>labelField</i>	the name of the field in the data provider items to display as the label. (Inherited from <i>FlexListBase</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexListBase</i>)
<i>lockedColumnCount</i>	the index of the first column in the control that scrolls. (Inherited from <i>FlexListBase</i>)
<i>lockedRowCount</i>	the index of the first row in the control that scrolls. (Inherited from <i>FlexListBase</i>)
<i>minColumnWidth</i>	The minimum width of the columns, in pixels. If not NaN, the DataGrid control applies this value as the minimum width for all columns. Otherwise, individual columns can have their own minimum widths. The default value is NaN.
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use <i>flash.display.DisplayObjectContainer.mouseChildren</i> . (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>FlexListBase</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>FlexListBase</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)

Name	Description
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>resizableColumns</i>	whether the user can change the size of the columns.
<i>rollOverColor</i>	the color of the background of a renderer when the user rolls over it. The default value is 0xEEFEE6. (Inherited from <i>FlexListBase</i>)
<i>rowCount</i>	the number of rows to be displayed. (Inherited from <i>FlexListBase</i>)
<i>rowHeight</i>	the height of the rows in pixels. (Inherited from <i>FlexListBase</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectable</i>	whether the list shows selected items as selected. (Inherited from <i>FlexListBase</i>)
<i>selectedIndex</i>	the index in the data provider of the selected item. (Inherited from <i>FlexListBase</i>)
<i>selectedIndices</i>	an array of indices in the data provider of the selected items. (Inherited from <i>FlexListBase</i>)
<i>selectedItem</i>	a reference to the selected item in the data provider. (Inherited from <i>FlexListBase</i>)
<i>selectedItems</i>	an array of references to the selected items in the data provider. (Inherited from <i>FlexListBase</i>)
<i>selectionColor</i>	the color of the background of a renderer when the user selects it. The default value is 0x7FCEFF. (Inherited from <i>FlexListBase</i>)
<i>selectionDisabledColor</i>	the color of the background of a renderer when the component is disabled. The default value is 0xDDDDDD. (Inherited from <i>FlexListBase</i>)
<i>showDataTips</i>	whether dataTips are displayed for text in the rows. (Inherited from <i>FlexListBase</i>)
<i>sortableColumns</i>	whether the user can sort the data provider items by clicking on a column header cell.
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TextObject</i>)

Name	Description
<i>textRollOverColor</i>	the text color of the label as the user moves the mouse pointer over the button. The default value is 0x2B333C. (Inherited from <i>FlexListBase</i>)
<i>textSelectedColor</i>	the color of the text of a renderer when the user selects it. The default value is 0x2B333C. (Inherited from <i>FlexListBase</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>useRollOver</i>	whether items are highlighted as the mouse rolls over them. (Inherited from <i>FlexListBase</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>variableRowHeight</i>	whether the individual rows can have different height. (Inherited from <i>FlexListBase</i>)
<i>verticalAlign</i>	the vertical alignment of a renderer in a row. (Inherited from <i>FlexListBase</i>)
<i>verticalGridLineColor</i>	the color of the vertical grid lines. The default value is 0x666666.
<i>verticalGridLines</i>	whether to show vertical grid lines between the columns.
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>wordWrap</i>	whether text in the row should be word wrapped. (Inherited from <i>FlexListBase</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant

Name	Description
	<i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
ColumnStretch	Dispatched when a user changes the width of a column, indicating that the amount of data displayed in that column may have changed.
Deselect	Defines the value of the type property of the event object for an event that is dispatched when a previously selected item is deselected. (Inherited from FlexListBase)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DoubleClick	Defines the value of the type property of the ListEvent object for an itemDoubleClick event, which indicates that the user double-clicked the mouse over a visual item in the control. (Inherited from FlexListBase)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from FlexListBase)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from FlexListBase)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from FlexListBase)
Edit	Defines the value of the type property of the event object for a itemEditBegin event, which indicates that an item is ready to be edited.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)

Name	Description
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from FlexListBase)
HeaderClick	Dispatched when the user releases the mouse button on a column header to request the control to sort the grid contents based on the contents of the column.
HeaderShift	Dispatched when the user releases the mouse button on a column header after having dragged the column to a new location resulting in shifting the column to a new index.
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from FlexScrollBase)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)

Name	Description
MultiSelect	Defines the value of the type property of the event object for an event that is dispatched when an item is selected as part of an action that selects multiple items. (Inherited from FlexListBase)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Scroll	Defines the value of the type property of the event object for a scroll event. (Inherited from FlexListBase)
ScrollToIndex	Ensures that the data provider item at the given index is visible. (Inherited from FlexListBase)
Select	Defines the value of the type property of the event object for an event that is dispatched when a single item is selected. (Inherited from FlexListBase)
SelectIndex	Defines the value of the type property of the event object for an event that is dispatched when a single item is selected. (Inherited from FlexListBase)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key. (Inherited from FlexListBase)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
<i>WaitForDisappearance</i>	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>) Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <i>OPT_WAIT_RESOLVE_OBJDEF</i> . Use <i>WaitForObject</i> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <i>WaitForObject</i> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <i>WaitForObject</i> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

FlexDateChooser Class

Description

Displays the name of a month, the year, and a grid of the days of the month, with columns labeled for the day of the week.

The user can select a date, a range of dates, or multiple dates. The control contains forward and back arrow buttons for changing the month and year.

You can let users select multiple dates, disable the selection of certain dates, and limit the display to a range of dates.

Inheritance Hierarchy

- *FlexObject*
 - FlexDateChooser

Syntax

```
'Declaration  
Public Class FlexDateChooser _  
Inherits FlexObject
```

Properties

Name	Description
<i>allowDisjointSelection</i>	whether non-contiguous selection is allowed in the DateChooser control.
<i>allowMultipleSelection</i>	whether multiple selection is allowed in the DateChooser control.
<i>alpha</i>	the alpha transparency value of the object specified. (Inherited from <i>FlexDisplayObject</i>)
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i>)
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>color</i>	the color of text in the component, including the component label. The default value is 0x0B333C.
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>disabledColor</i>	the color of text in the component if it is disabled. The default value is 0xAAB3B3.
<i>disabledDays</i>	the days to disable in a week.
<i>disabledRanges</i>	the single and multiple days to disable.
<i>displayedMonth</i>	the month displayed in the DateChooser control.
<i>displayedYear</i>	the year displayed in the DateChooser control. The default value is the current year.
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>fillColors</i>	the colors used to tint the background of the control.

Name	Description
<i>firstDayOfWeek</i>	the number representing the day of the week to display in the first column of the DateChooser control.
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use.
<i>fontSize</i>	the height of the text, in pixels.
<i>fontStyle</i>	whether the text is italic font.
<i>fontWeight</i>	whether the text is boldface.
<i>headerColors</i>	the colors of the band at the top of the DateChooser control. The default value is [0xE6EEEE, 0xFFFFFFFF].
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>maxYear</i>	the last year selectable in the control.
<i>minYear</i>	the first year selectable in the control.
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>rollOverColor</i>	the color of the highlight area of the date when the user holds the mouse pointer over a date in the DateChooser control. The default value is 0xE3FFD6.
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectedDate</i>	the date as selected in the DateChooser control.
<i>selectedRanges</i>	the selected date ranges.
<i>selectionColor</i>	the color of the highlight area of the currently selected date in the DateChooser control. The default value is 0xCDFFC1.

Name	Description
<i>showToday</i>	whether today's date is highlighted in the DataChooser control.
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>textAlign</i>	whether the text is boldface.
<i>textDecoration</i>	whether the text is underlined.
<i>textIndent</i>	the offset of first line of text from the left side of the container, in pixels. The default value is 0.
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>todayColor</i>	the color of the highlight of today's date in the DateChooser control. The default value is 0x2B333.
<i>toolTip</i>	the text to display in the ToolTip. The default value is <i>Nothing</i> . (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <i>useHandCursor</i> is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>yearNavigationEnabled</i>	whether year navigation is enabled.

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding.

Name	Description
	In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Change	Dispatched when a date is selected or changed.
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)

Name	Description
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>Move</i>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <i>FlexObject</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ScrollDate</i>	The <i>DateChooserEvent.SCROLL</i> constant defines the value of the type property of the event object for a scrollevent.
<i>SetFocus</i>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <i>FlexObject</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>ToString</i>	Returns a string representation of the control. (Inherited from <i>FlexDisplayObject</i>)
<i>Type</i>	Dispatched when the user presses a key.
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)

Name	Description
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexDateField Class

Description

A text field that shows the date with a calendar icon on its right side.

When the user clicks anywhere inside the bounding box of the control, a `DateChooser` control pops up and shows the dates in the month of the current date. If no date is selected, the text field is blank and the month of the current date is displayed in the `DateChooser` control.

Inheritance Hierarchy

- [FlexComboBase](#)
 - FlexDateField

Syntax

```
'Declaration
Public Class FlexDateField _
Inherits FlexComboBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
backgroundAlpha	the alpha level of the color defined by the backgroundColor property, of the image or SWF file defined by the backgroundImage style. (Inherited from FlexComboBase)
backgroundColor	the background color of a component. (Inherited from FlexComboBase)
backgroundImage	the background image of a component. (Inherited from FlexComboBase)
backgroundSize	the percentage to change the image size to for the specified backgroundImage. (Inherited from FlexComboBase)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
color	the color of text in the component, including the component label. (Inherited from FlexComboBase)
currentState	the current view state of the component. (Inherited from FlexObject)
disabledColor	the background color of the component when it is disabled. (Inherited from FlexComboBase)
disabledDays	the days to disable in a week.
disabledRanges	the disabled single and multiple days.
displayedMonth	the month that is displayed in the DateChooser control.
displayedYear	the year that is displayed in the DateChooser control.
dropShadowEnabled	whether the ComboBase container's drop shadow is visible. The default value is true. (Inherited from FlexComboBase)

Name	Description
<i>editable</i>	whether the control is editable, which lets the user directly type entries that are not specified in the dataProvider, or not editable, which requires the user select from the items in the dataProvider. (Inherited from <i>FlexComboBase</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>fillAlphas</i>	the alphas used for the background fill of controls. (Inherited from <i>FlexComboBase</i>)
<i>fillColors</i>	the colors used to tint the background of the control. (Inherited from <i>FlexComboBase</i>)
<i>firstDayOfWeek</i>	the day of the week (0-6, where 0 is the first element of the dayNames Array) to display in the first column of the DateChooser control.
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use. (Inherited from <i>FlexComboBase</i>)
<i>fontSize</i>	the height of the text, in pixels. (Inherited from <i>FlexComboBase</i>)
<i>fontStyle</i>	whether the text is italic font. (Inherited from <i>FlexComboBase</i>)
<i>fontWeight</i>	whether the text is boldface. (Inherited from <i>FlexComboBase</i>)
<i>headerColors</i>	the colors of the band at the top of the DateChooser control. The default value is [0xE6EEEE, 0xFFFFFFFF].
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>highlightColor</i>	the highlight color of the drop-down list. (Inherited from <i>FlexComboBase</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>maxYear</i>	the last year selectable in the control.
<i>minYear</i>	the first year selectable in the control.
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)

Name	Description
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>restrict</i>	the set of characters that a user can or cannot enter into the text field. (Inherited from <i>FlexComboBase</i>)
<i>rollOverColor</i>	the color of the highlight area of the date when the user holds the mouse pointer over a date in the DateChooser control. The default value is 0xE3FFD6.
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectedDate</i>	the date as selected in the DateChooser control.
<i>selectedIndex</i>	the index in the data provider of the selected item. (Inherited from <i>FlexComboBase</i>)
<i>showToday</i>	the day highlighted in the DateChooser control.
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>text</i>	the contents of the text field. (Inherited from <i>FlexComboBase</i>)
<i>textAlign</i>	the alignment of text within a container. Possible values are:left, right, or center. (Inherited from <i>FlexComboBase</i>)
<i>textDecoration</i>	whether the text is underlined. (Inherited from <i>FlexComboBase</i>)
<i>textIndent</i>	the offset of first line of text from the left side of the container, in pixels. The default value is 0. (Inherited from <i>FlexComboBase</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>todayColor</i>	the color of the highlight of today's date in the DateChooser control. The default value is 0x2B333.
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)

Name	Description
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>yearNavigationEnabled</i>	whether the year up and down buttons are available for navigation.

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>Change</i>	Dispatched when a date is selected or changed, and the DateChooser control closes.
<i>ChangeFocus</i>	Changes the current focus. (Inherited from <i>FlexObject</i>)
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i>)
<i>Close</i>	Defines the value of the type property of the event object for a close event. (Inherited from <i>FlexComboBase</i>)
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i>)
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)

Name	Description
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Input	Creates an Event object that contains information about text events. Event objects are passed as parameters to event listeners. (Inherited from FlexComboBase)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
Open	Defines the value of the type property of the event object for a open event. (Inherited from FlexComboBase)

Name	Description
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Scroll	Defines the value of the type property of the event object for a scroll event. (Inherited from FlexComboBase)
ScrollDate	The DateChooserEvent.SCROLL constant defines the value of the type property of the event object for a scrollevent.
SelectText	Lets you track selection within a text field. (Inherited from FlexComboBase)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key. (Inherited from FlexComboBase)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForObject	Waits for an object that matches the specified locator. If no object matches within a timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexDisplayObject Class

Description

The base class for all objects that can be placed on the display list. The display list manages all objects displayed in Flash Player or Adobe AIR.

Inheritance Hierarchy

- [TestObject](#)
 - FlexDisplayObject
 - [FlexListLabel](#)
 - [FlexObject](#)
 - [FlexUIMovieClip](#)

Syntax

```
'Declaration
Public Class FlexDisplayObject _
Inherits TestObject _
Implements IClickable, IKeyable
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified.
height	the height of the display object, in pixels.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren.
tabChildren	whether the children of the display object are tab enabled. The default is true.
tabEnabled	whether this object is in the tab order.
tabIndex	the tab ordering of objects in a SWF file.
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
visible	whether the display object is visible.
width	the width of the display object, in pixels.
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer.
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)

Name	Description
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>GetStyle</i>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation.
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)

Name	Description
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the

Name	Description
	optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

FlexDividedBox Class

Description

Measures and lays out its children horizontally or vertically in exactly the same way as a Box container, but it inserts draggable dividers in the gaps between the children. Users can drag any divider to resize the children on each side.

The *DividedBox* class is the base class for the *HDividedBox* and *VDividedBox* classes.

Inheritance Hierarchy

- *FlexBox*
 - FlexDividedBox

Syntax

```
'Declaration
Public Class FlexDividedBox _
Inherits FlexBox
```

Properties

Name	Description
<i>alpha</i>	the alpha transparency value of the object specified. (Inherited from <i>FlexDisplayObject</i>)
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i>)
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)

Name	Description
<i>backgroundAlpha</i>	the alpha level of the color defined by the <code>backgroundColor</code> property, of the image or SWF file defined by the <code>backgroundImage</code> style. Valid values range from 0.0 to 1.0. (Inherited from <i>FlexContainer</i>)
<i>backgroundColor</i>	the background color of a component. (Inherited from <i>FlexContainer</i>)
<i>backgroundDisabledColor</i>	the background color of the component when it is disabled. The global default value is undefined. (Inherited from <i>FlexContainer</i>)
<i>backgroundImage</i>	the background image of a component. This can be an absolute or relative URL or class. (Inherited from <i>FlexContainer</i>)
<i>backgroundSize</i>	the percentage to change the image size to for the specified <code>backgroundImage</code> . (Inherited from <i>FlexContainer</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>FlexContainer</i>)
<i>creationIndex</i>	the order to instantiate and draw the children of the container. (Inherited from <i>FlexContainer</i>)
<i>creationPolicy</i>	the child creation policy for this Container. (Inherited from <i>FlexContainer</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>direction</i>	whether to use vertical (default) or horizontal layout. (Inherited from <i>FlexBox</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>fillAlphas</i>	the alpha transparency values used for the background fill of components. (Inherited from <i>FlexContainer</i>)
<i>fillColors</i>	the colors used to tint the background fill of the component. (Inherited from <i>FlexContainer</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexContainer</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use. (Inherited from <i>FlexContainer</i>)
<i>fontSize</i>	the height of the text, in pixels. (Inherited from <i>FlexContainer</i>)
<i>fontStyle</i>	whether the text is italic font. (Inherited from <i>FlexContainer</i>)
<i>fontWeight</i>	whether the text is boldface. (Inherited from <i>FlexContainer</i>)

Name	Description
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>horizontalAlign</i>	the horizontal alignment of children in the container. (Inherited from <i>FlexBox</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>label</i>	the text displayed by some navigator containers to represent this Container. (Inherited from <i>FlexContainer</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexContainer</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numChildren</i>	the number of child components in this container. (Inherited from <i>FlexContainer</i>)
<i>numColumns</i>	the total number of columns of data available. (Inherited from <i>FlexContainer</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>FlexContainer</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>resizeToContent</i>	whether the DividedBox automatically resizes to the size of its children.
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)

Name	Description
themeColor	the theme color of a component. (Inherited from FlexObject)
toolTip	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from FlexObject)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is <code>true</code> . If <code>useHandCursor</code> is <code>false</code> , the arrow pointer is used instead. (Inherited from FlexObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
verticalAlign	the vertical alignment of children in the container. (Inherited from FlexBox)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from FlexDisplayObject)
y	the y coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Defines the value of the type property of the event object for a <code>dragComplete</code> event. (Inherited from FlexContainer)
DragDrop	Defines the value of the type property of the event object for a <code>dragDrop</code> event. (Inherited from FlexContainer)
Dragged	Dispatched multiple times as the user drags any divider. The <code>dividerDrag</code> event is dispatched after the <code>dividerPress</code> event and before the <code>dividerRelease</code> event.

Name	Description
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from FlexContainer)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. The return value is an array of rows, each of which is an array of items. (Inherited from FlexContainer)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)

Name	Description
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from FlexContainer)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
Pressed	Dispatched when the user presses any divider in this container.
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Released	Dispatched when the user releases a divider.
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Scroll	Dispatched when the user manually scrolls the container. (Inherited from FlexContainer)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)

Name	Description
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

FlexForm Class

Description

Use this class to control the layout of a form, mark form fields as required or optional, handle error messages, and bind your form data to the Flex data model to perform data checking and validation. This class also lets you use style sheets to configure the appearance of your forms.

Inheritance Hierarchy

- *FlexContainer*
 - FlexForm

Syntax

```
'Declaration  
Public Class FlexForm _  
Inherits FlexContainer
```

Properties

Name	Description
<i>alpha</i>	the alpha transparency value of the object specified. (Inherited from <i>FlexDisplayObject</i>)
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i>)
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>backgroundAlpha</i>	the alpha level of the color defined by the <i>backgroundColor</i> property, of the image or SWF file defined by the <i>backgroundImage</i> style. Valid values range from 0.0 to 1.0. (Inherited from <i>FlexContainer</i>)
<i>backgroundColor</i>	the background color of a component. (Inherited from <i>FlexContainer</i>)
<i>backgroundDisabledColor</i>	the background color of the component when it is disabled. The global default value is undefined. (Inherited from <i>FlexContainer</i>)
<i>backgroundImage</i>	the background image of a component. This can be an absolute or relative URL or class. (Inherited from <i>FlexContainer</i>)
<i>backgroundSize</i>	the percentage to change the image size to for the specified <i>backgroundImage</i> . (Inherited from <i>FlexContainer</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>FlexContainer</i>)
<i>creationIndex</i>	the order to instantiate and draw the children of the container. (Inherited from <i>FlexContainer</i>)
<i>creationPolicy</i>	the child creation policy for this Container. (Inherited from <i>FlexContainer</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)

Name	Description
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>fillAlphas</i>	the alpha transparency values used for the background fill of components. (Inherited from <i>FlexContainer</i>)
<i>fillColors</i>	the colors used to tint the background fill of the component. (Inherited from <i>FlexContainer</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexContainer</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use. (Inherited from <i>FlexContainer</i>)
<i>fontSize</i>	the height of the text, in pixels. (Inherited from <i>FlexContainer</i>)
<i>fontStyle</i>	whether the text is italic font. (Inherited from <i>FlexContainer</i>)
<i>fontWeight</i>	whether the text is boldface. (Inherited from <i>FlexContainer</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>label</i>	the text displayed by some navigator containers to represent this Container. (Inherited from <i>FlexContainer</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexContainer</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numChildren</i>	the number of child components in this container. (Inherited from <i>FlexContainer</i>)
<i>numColumns</i>	the total number of columns of data available. (Inherited from <i>FlexContainer</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>FlexContainer</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)

Name	Description
scaleX	the number that specifies the horizontal scaling factor. (Inherited from FlexObject)
scaleY	the number that specifies the vertical scaling factor. (Inherited from FlexObject)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from FlexDisplayObject)
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TextObject)
themeColor	the theme color of a component. (Inherited from FlexObject)
toolTip	the text to display in the ToolTip. The default value is Nothing. (Inherited from FlexObject)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from FlexObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TextObject)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TextObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)

Name	Description
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from FlexContainer)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from FlexContainer)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from FlexContainer)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. The return value is an array of rows, each of which is an array of items. (Inherited from FlexContainer)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)

Name	Description
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from FlexContainer)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Scroll	Dispatched when the user manually scrolls the container. (Inherited from FlexContainer)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)

Name	Description
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexFormItem Class

Description

Defines a label and one or more children arranged horizontally or vertically. Children can be controls or other containers. A single Form container can hold multiple FormItem containers.

Inheritance Hierarchy

- [FlexContainer](#)
 - FlexFormItem

Syntax

```
'Declaration
Public Class FlexFormItem _
Inherits FlexContainer
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
backgroundAlpha	the alpha level of the color defined by the backgroundColor property, of the image or SWF file defined by the backgroundImage style. Valid values range from 0.0 to 1.0. (Inherited from FlexContainer)
backgroundColor	the background color of a component. (Inherited from FlexContainer)
backgroundDisabledColor	the background color of the component when it is disabled. The global default value is undefined. (Inherited from FlexContainer)
backgroundImage	the background image of a component. This can be an absolute or relative URL or class. (Inherited from FlexContainer)
backgroundSize	the percentage to change the image size to for the specified backgroundImage. (Inherited from FlexContainer)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
columnNames	a list containing the names of all columns in the data. (Inherited from FlexContainer)
creationIndex	the order to instantiate and draw the children of the container. (Inherited from FlexContainer)

Name	Description
<i>creationPolicy</i>	the child creation policy for this Container. (Inherited from <i>FlexContainer</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>fillAlphas</i>	the alpha transparency values used for the background fill of components. (Inherited from <i>FlexContainer</i>)
<i>fillColors</i>	the colors used to tint the background fill of the component. (Inherited from <i>FlexContainer</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexContainer</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use. (Inherited from <i>FlexContainer</i>)
<i>fontSize</i>	the height of the text, in pixels. (Inherited from <i>FlexContainer</i>)
<i>fontStyle</i>	whether the text is italic font. (Inherited from <i>FlexContainer</i>)
<i>fontWeight</i>	whether the text is boldface. (Inherited from <i>FlexContainer</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>horizontalAlign</i>	the horizontal alignment of children in the container.
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>label</i>	the text displayed by some navigator containers to represent this Container. (Inherited from <i>FlexContainer</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexContainer</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numChildren</i>	the number of child components in this container. (Inherited from <i>FlexContainer</i>)

Name	Description
<i>numColumns</i>	the total number of columns of data available. (Inherited from <i>FlexContainer</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>FlexContainer</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or <i>explicitWidth</i> properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is <i>Nothing</i> . (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <i>useHandCursor</i> is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the <i>DisplayObject</i> instance relative to the local coordinates of the parent <i>DisplayObjectContainer</i> . (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the <i>DisplayObject</i> instance relative to the local coordinates of the parent <i>DisplayObjectContainer</i> . (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from FlexContainer)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from FlexContainer)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from FlexContainer)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. The return value is an array of rows, each of which is an array of items. (Inherited from FlexContainer)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from FlexContainer)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Scroll	Dispatched when the user manually scrolls the container. (Inherited from FlexContainer)

Name	Description
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout

Name	Description
	specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexHLOCChart Class

Description

The HLOCChart (High Low Open Close) control represents financial data as a series of elements representing the high, low, closing, and optionally opening values of a data series.

The top and bottom of the vertical line in each element represent the high and low values for the datapoint. The right-facing tick represents the closing values, and the left tick represents the opening value if one was specified.

Inheritance Hierarchy

- [FlexCartesianChart](#)
 - FlexHLOCChart

Syntax

```
'Declaration
Public Class FlexHLOCChart _
Inherits FlexCartesianChart
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
clipContent	whether Flex clips the chart to the area bounded by the axes. Set to false to clip the chart. Set to true to avoid clipping when the data is rendered. (Inherited from FlexChart)

Name	Description
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>FlexChart</i>)
<i>columnWidthRatio</i>	a ratio of how wide to draw the HLOC lines relative to the horizontal axis's category widths, as a percentage in the range of 0 to 1.
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>dataTipMode</i>	how Flex displays DataTip controls for the chart. (Inherited from <i>FlexChart</i>)
<i>description</i>	a short description of the data in the chart. (Inherited from <i>FlexChart</i>)
<i>dragEnabled</i>	whether you can drag items out of this chart and drop them on other controls. (Inherited from <i>FlexChart</i>)
<i>dropEnabled</i>	whether dragged items can be dropped onto the chart. (Inherited from <i>FlexChart</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexChart</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use. (Inherited from <i>FlexChart</i>)
<i>fontSize</i>	the height of the text, in pixels. The default value is 10 for all controls except the ColorPicker control. For the ColorPicker control, the default value is 11. (Inherited from <i>FlexChart</i>)
<i>gutterBottom</i>	The size of the region, in pixels, between the bottom of the chart data area and the bottom of the chart control. (Inherited from <i>FlexCartesianChart</i>)
<i>gutterLeft</i>	The size of the region, in pixels, between the left of the chart data area and the left of the chart control. (Inherited from <i>FlexCartesianChart</i>)
<i>gutterRight</i>	The size of the region, in pixels, between the right side of the chart data area and the outside of the chart control. (Inherited from <i>FlexCartesianChart</i>)
<i>gutterTop</i>	The size of the region, in pixels, between the top of the chart data area and the top of the chart control. (Inherited from <i>FlexCartesianChart</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)

Name	Description
<i>horizontalAxisRatio</i>	the height limit of the horizontal axis. (Inherited from <i>FlexCartesianChart</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexChart</i>)
<i>maxColumnWidth</i>	how wide to draw the HLOC lines, in pixels.
<i>maximumDataTipCount</i>	the maximum number of datatips a chart will show. (Inherited from <i>FlexChart</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>mouseSensitivity</i>	the distance, in pixels, that Flex considers a data point to be under the mouse pointer when the pointer moves around a chart. (Inherited from <i>FlexChart</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>FlexChart</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>FlexChart</i>)
<i>paddingBottom</i>	the number of pixels between the chart's bottom border and its content area. (Inherited from <i>FlexChart</i>)
<i>paddingLeft</i>	the number of pixels between the control's left border and the left edge of its content area. The default value is 2. (Inherited from <i>FlexChart</i>)
<i>paddingRight</i>	the number of pixels between the control's right border and the right edge of its content area. The default value is 0. (Inherited from <i>FlexChart</i>)
<i>paddingTop</i>	the number of pixels between the chart's top border and its content area. (Inherited from <i>FlexChart</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)

Name	Description
<i>selectedChartItem</i>	the selected ChartItem in the chart. If multiple items are selected, this property specifies the most recently selected item. (Inherited from <i>FlexChart</i>)
<i>selectedChartItems</i>	an array of all the selected ChartItem objects in the chart. (Inherited from <i>FlexChart</i>)
<i>selectionMode</i>	whether ChartItem objects can be selected. (Inherited from <i>FlexChart</i>)
<i>showDataTips</i>	whether DataTip controls for the chart show. (Inherited from <i>FlexChart</i>)
<i>showDataTipTargets</i>	whether to show targets over the datapoints when showDataTips is set to true. (Inherited from <i>FlexChart</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>textAlign</i>	the alignment of text within a container. (Inherited from <i>FlexCartesianChart</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>verticalAxisRatio</i>	the width limit of the vertical axis. (Inherited from <i>FlexCartesianChart</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from FlexChart)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from FlexChart)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from FlexChart)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from FlexChart)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Select	Defines the value of the type property of the event object for a headerRelease event, which indicates that the user pressed and released the mouse on a column header. (Inherited from FlexChart)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)

Name	Description
 SetProperty 	Sets the value of the specified property. (Inherited from TestObject)
 TextCapture 	Returns the text in this object's visible area. (Inherited from TestObject)
 TextClick 	Clicks in the center of the specified text. (Inherited from TestObject)
 TextExists 	Returns whether the specified text exists. (Inherited from TestObject)
 TextRectangle 	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
 ToString 	Returns a string representation of the control. (Inherited from FlexDisplayObject)
 TypeKeys 	Sends a set of keystrokes to the object. (Inherited from IKeyable)
 TypePasswordKeys 	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
 WaitForChildDisappearance 	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForDisappearance 	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForObject 	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
 WaitForProperty 	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForPropertyNotEquals 	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexHLOCSeries Class

Description

Represents financial data as a series of elements representing the high, low, closing, and, optionally, opening values of a data series.

The top and bottom of the vertical line in each element represent the high and low values for the datapoint. The right-facing tick mark represents the closing value, and the left tick mark represents the opening value, if one was specified.

Inheritance Hierarchy

- [FlexHLOCSeriesBase](#)
 - FlexHLOCSeries

Syntax

```
'Declaration
Public Class FlexHLOCSeries _
Inherits FlexHLOCSeriesBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
columnNames	a list containing the names of all columns in the data. (Inherited from FlexChartSeries)
columnWidthRatio	the width of elements relative to the category width. (Inherited from FlexHLOCSeriesBase)
currentState	the current view state of the component. (Inherited from FlexObject)

Name	Description
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexChartSeries</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexChartSeries</i>)
<i>maxColumnWidth</i>	the width of the elements, in pixels. (Inherited from <i>FlexHLOCSeriesBase</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>FlexChartSeries</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>FlexChartSeries</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectedIndex</i>	the index of the selected item in the data provider of the series. (Inherited from <i>FlexChartSeries</i>)

Name	Description
<i>selectedIndices</i>	an array of indexes of the selected items in the data provider of the series. (Inherited from <i>FlexChartSeries</i>)
<i>selectedItem</i>	the chart item that is selected in the series. (Inherited from <i>FlexChartSeries</i>)
<i>selectedItems</i>	an array of chart items that are selected in the series. (Inherited from <i>FlexChartSeries</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <i>useHandCursor</i> is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the <i>DisplayObject</i> instance relative to the local coordinates of the parent <i>DisplayObjectContainer</i> . (Inherited from <i>FlexDisplayObject</i>)
<i>xField</i>	the field of the data provider that determines the x-axis location of the element. (Inherited from <i>FlexHLOCSeriesBase</i>)
<i>y</i>	the y coordinate of the <i>DisplayObject</i> instance relative to the local coordinates of the parent <i>DisplayObjectContainer</i> . (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant

Name	Description
	<i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject . (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from FlexChartSeries)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)

Name	Description
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SeriesClick	Indicates that the user clicked the mouse button over a chart item representing data in the chart. (Inherited from FlexChartSeries)
SeriesDoubleClick	Indicates that the user double-clicked the mouse button over a chart item representing data in the chart. (Inherited from FlexChartSeries)
SeriesItemRollOver	Indicates that the user rolled the mouse pointer over a chart item representing data in the chart. (Inherited from FlexChartSeries)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)

Name	Description
<i>ToString</i>	Returns a string representation of the control. (Inherited from <i>FlexDisplayObject</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

FlexHLOCSeriesBase Class

Description

Represents financial data as a series of elements representing the high, low, closing, and, optionally, opening values of a data series.

The top and bottom of the vertical line in each element represent the high and low values for the datapoint. The right-facing tick mark represents the closing value, and the left tick mark represents the opening value, if one was specified.

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
columnNames	a list containing the names of all columns in the data. (Inherited from FlexChartSeries)
columnWidthRatio	the width of elements relative to the category width.
currentState	the current view state of the component. (Inherited from FlexObject)
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)

Name	Description
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from FlexObject)
firstVisibleRow	the index of the first visible child. (Inherited from FlexChartSeries)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from FlexObject)
height	the height of the display object, in pixels. (Inherited from FlexDisplayObject)
id	the ID of the component. (Inherited from FlexObject)
lastVisibleRow	the index of the last visible child. (Inherited from FlexChartSeries)
maxColumnWidth	the width of the elements, in pixels.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from FlexDisplayObject)
numAutomationChildren	the number of automation children this container has. (Inherited from FlexObject)
numColumns	the total number of columns in the data available. (Inherited from FlexChartSeries)
numRows	the total number of rows of data available. (Inherited from FlexChartSeries)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from FlexObject)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from FlexObject)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from FlexObject)
scaleY	the number that specifies the vertical scaling factor. (Inherited from FlexObject)
selectedIndex	the index of the selected item in the data provider of the series. (Inherited from FlexChartSeries)
selectedIndices	an array of indexes of the selected items in the data provider of the series. (Inherited from FlexChartSeries)
selectedItem	the chart item that is selected in the series. (Inherited from FlexChartSeries)

Name	Description
<i>selectedItems</i>	an array of chart items that are selected in the series. (Inherited from <i>FlexChartSeries</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>xField</i>	the field of the data provider that determines the x-axis location of the element.
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>ChangeFocus</i>	Changes the current focus. (Inherited from <i>FlexObject</i>)
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i>)

Name	Description
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)

GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from FlexChartSeries)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)

Name	Description
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SeriesClick	Indicates that the user clicked the mouse button over a chart item representing data in the chart. (Inherited from FlexChartSeries)
SeriesDoubleClick	Indicates that the user double-clicked the mouse button over a chart item representing data in the chart. (Inherited from FlexChartSeries)
SeriesItemRollOver	Indicates that the user rolled the mouse pointer over a chart item representing data in the chart. (Inherited from FlexChartSeries)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)

Name	Description
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

FlexImage Class

Description

Lets you import JPEG, PNG, GIF, and SWF files at runtime.

You can also embed any of these files and SVG files at compile time by using `@Embed(source='filename')`.

Note: Flex also includes the SWFLoader control for loading Flex applications. You typically use the Image control for loading static graphic files and SWF files, and use the SWFLoader control for loading Flex applications. The Image control is also designed to be used in custom item renderers and item editors.

id	the ID of the component. (Inherited from FlexObject)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list,

Name	Description
	use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or <i>explicitWidth</i> properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>source</i>	The URL, object, class or string name of a class to load as the content. (Inherited from <i>FlexLoader</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <i>useHandCursor</i> is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)

Name	Description
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)

Name	Description
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexLabel Class

Description

Displays a single line of noneditable text.

Inheritance Hierarchy

- *FlexObject*
 - FlexLabel

Syntax

```
'Declaration  
Public Class FlexLabel _  
Inherits FlexObject
```

Properties

Name	Description
<i>alpha</i>	the alpha transparency value of the object specified. (Inherited from <i>FlexDisplayObject</i>)
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i>)
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>color</i>	the color of text in the component, including the component label. The default value is 0x0B333C.
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>disabledColor</i>	the color of text in the component if it is disabled. The default value is 0xAAB3B3.
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use.
<i>fontSize</i>	the height of the text, in pixels.
<i>fontStyle</i>	whether the text is italic font.
<i>fontWeight</i>	whether the text is boldface.
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)

Name	Description
<i>htmlText</i>	the text displayed by the Label control, including HTML markup that expresses the styles of that text.
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>text</i>	the plain text displayed by this control. Its appearance is determined by the CSS styles of this Label control.
<i>textAlign</i>	the alignment of text within a container.
<i>textDecoration</i>	whether the text is underlined.
<i>textIndent</i>	the offset of the first line of text from the left side of the container, in pixels. The default value is 0.
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)

Name	Description
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)

Name	Description
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>GetStyle</i>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <i>FlexDisplayObject</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>Move</i>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <i>FlexObject</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)

Name	Description
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexLineChart Class

Description

Represents a data series as points connected by a continuous line.

You can use an icon or symbol to represent each data point along the line, or show a simple line with no icons.

Inheritance Hierarchy

- [FlexCartesianChart](#)
 - FlexLineChart

Syntax

```
'Declaration
Public Class FlexLineChart _
Inherits FlexCartesianChart
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
clipContent	whether Flex clips the chart to the area bounded by the axes. Set to false to clip the chart. Set to true to avoid clipping when the data is rendered. (Inherited from FlexChart)

Name	Description
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>FlexChart</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>dataTipMode</i>	how Flex displays DataTip controls for the chart. (Inherited from <i>FlexChart</i>)
<i>description</i>	a short description of the data in the chart. (Inherited from <i>FlexChart</i>)
<i>dragEnabled</i>	whether you can drag items out of this chart and drop them on other controls. (Inherited from <i>FlexChart</i>)
<i>dropEnabled</i>	whether dragged items can be dropped onto the chart. (Inherited from <i>FlexChart</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexChart</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use. (Inherited from <i>FlexChart</i>)
<i>fontSize</i>	the height of the text, in pixels. The default value is 10 for all controls except the ColorPicker control. For the ColorPicker control, the default value is 11. (Inherited from <i>FlexChart</i>)
<i>gutterBottom</i>	The size of the region, in pixels, between the bottom of the chart data area and the bottom of the chart control. (Inherited from <i>FlexCartesianChart</i>)
<i>gutterLeft</i>	The size of the region, in pixels, between the left of the chart data area and the left of the chart control. (Inherited from <i>FlexCartesianChart</i>)
<i>gutterRight</i>	The size of the region, in pixels, between the right side of the chart data area and the outside of the chart control. (Inherited from <i>FlexCartesianChart</i>)
<i>gutterTop</i>	The size of the region, in pixels, between the top of the chart data area and the top of the chart control. (Inherited from <i>FlexCartesianChart</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>horizontalAxisRatio</i>	the height limit of the horizontal axis. (Inherited from <i>FlexCartesianChart</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)

Name	Description
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexChart</i>)
<i>maximumDataTipCount</i>	the maximum number of datatips a chart will show. (Inherited from <i>FlexChart</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>mouseSensitivity</i>	the distance, in pixels, that Flex considers a data point to be under the mouse pointer when the pointer moves around a chart. (Inherited from <i>FlexChart</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>FlexChart</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>FlexChart</i>)
<i>paddingBottom</i>	the number of pixels between the chart's bottom border and its content area. (Inherited from <i>FlexChart</i>)
<i>paddingLeft</i>	the number of pixels between the control's left border and the left edge of its content area. The default value is 2. (Inherited from <i>FlexChart</i>)
<i>paddingRight</i>	the number of pixels between the control's right border and the right edge of its content area. The default value is 0. (Inherited from <i>FlexChart</i>)
<i>paddingTop</i>	the number of pixels between the chart's top border and its content area. (Inherited from <i>FlexChart</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectedChartItem</i>	the selected ChartItem in the chart. If multiple items are selected, this property specifies the most recently selected item. (Inherited from <i>FlexChart</i>)

Name	Description
<i>selectedChartItems</i>	an array of all the selected ChartItem objects in the chart. (Inherited from <i>FlexChart</i>)
<i>selectionMode</i>	whether ChartItem objects can be selected. (Inherited from <i>FlexChart</i>)
<i>showDataTips</i>	whether DataTip controls for the chart show. (Inherited from <i>FlexChart</i>)
<i>showDataTipTargets</i>	whether to show targets over the datapoints when showDataTips is set to true. (Inherited from <i>FlexChart</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TextObject</i>)
<i>textAlign</i>	the alignment of text within a container. (Inherited from <i>FlexCartesianChart</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TextObject</i>)
<i>verticalAxisRatio</i>	the width limit of the vertical axis. (Inherited from <i>FlexCartesianChart</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location

Name	Description
	on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from FlexChart)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from FlexChart)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from FlexChart)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)

Name	Description
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from FlexChart)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Select	Defines the value of the type property of the event object for a headerRelease event, which indicates that the user pressed and released the mouse on a column header. (Inherited from FlexChart)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)

Name	Description
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If

Name	Description
	you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexLineSeries Class

Description

Defines a data series for a LineChart control.

Inheritance Hierarchy

- [FlexChartSeries](#)
 - FlexLineSeries

Syntax

```
'Declaration
Public Class FlexLineSeries _
Inherits FlexChartSeries
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
columnNames	a list containing the names of all columns in the data. (Inherited from FlexChartSeries)
currentState	the current view state of the component. (Inherited from FlexObject)
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from FlexObject)

Name	Description
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexChartSeries</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>form</i>	the line type for the chart.
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexChartSeries</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>FlexChartSeries</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>FlexChartSeries</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>radius</i>	the radius, in pixels, of the chart elements for the data points.
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectedIndex</i>	the index of the selected item in the data provider of the series. (Inherited from <i>FlexChartSeries</i>)
<i>selectedIndices</i>	an array of indexes of the selected items in the data provider of the series. (Inherited from <i>FlexChartSeries</i>)
<i>selectedItem</i>	the chart item that is selected in the series. (Inherited from <i>FlexChartSeries</i>)
<i>selectedItems</i>	an array of chart items that are selected in the series. (Inherited from <i>FlexChartSeries</i>)

Name	Description
sortOnXField	whether the line datapoints are sorted from left to right before rendering.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from FlexDisplayObject)
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TestObject)
themeColor	the theme color of a component. (Inherited from FlexObject)
toolTip	the text to display in the ToolTip. The default value is Nothing. (Inherited from FlexObject)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from FlexObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
xField	the field of the data provider that determines the x-axis location of each data point.
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
yField	the field of the data provider that determines the y-axis location of each data point.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)

Name	Description
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from FlexChartSeries)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)

Name	Description
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SeriesClick	Indicates that the user clicked the mouse button over a chart item representing data in the chart. (Inherited from FlexChartSeries)
SeriesDoubleClick	Indicates that the user double-clicked the mouse button over a chart item representing data in the chart. (Inherited from FlexChartSeries)
SeriesItemRollOver	Indicates that the user rolled the mouse pointer over a chart item representing data in the chart. (Inherited from FlexChartSeries)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)

Name	Description
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexLinkBar Class

Description

Defines a horizontal or vertical row of `LinkButton` controls that designate a series of link destinations.

You typically use a `LinkBar` control to control the active child container of a `ViewStack` container, or to create a stand-alone set of links.

Inheritance Hierarchy

- [FlexNavigationBar](#)
 - FlexLinkBar

Syntax

```
'Declaration
Public Class FlexLinkBar _
Inherits FlexNavigationBar
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
backgroundAlpha	the alpha level of the color defined by the backgroundColor property, of the image or SWF file defined by the backgroundImage style. Valid values range from 0.0 to 1.0. (Inherited from FlexContainer)
backgroundColor	the background color of a component. (Inherited from FlexContainer)
backgroundDisabledColor	the background color of the component when it is disabled. The global default value is undefined. (Inherited from FlexContainer)
backgroundImage	the background image of a component. This can be an absolute or relative URL or class. (Inherited from FlexContainer)
backgroundSize	the percentage to change the image size to for the specified backgroundImage. (Inherited from FlexContainer)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
columnNames	a list containing the names of all columns in the data. (Inherited from FlexContainer)
creationIndex	the order to instantiate and draw the children of the container. (Inherited from FlexContainer)
creationPolicy	the child creation policy for this Container. (Inherited from FlexContainer)
currentState	the current view state of the component. (Inherited from FlexObject)
direction	whether to use vertical (default) or horizontal layout. (Inherited from FlexBox)
enabled	whether the component can accept user interaction. (Inherited from FlexObject)

Name	Description
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>fillAlphas</i>	the alpha transparency values used for the background fill of components. (Inherited from <i>FlexContainer</i>)
<i>fillColors</i>	the colors used to tint the background fill of the component. (Inherited from <i>FlexContainer</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexContainer</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use. (Inherited from <i>FlexContainer</i>)
<i>fontSize</i>	the height of the text, in pixels. (Inherited from <i>FlexContainer</i>)
<i>fontStyle</i>	whether the text is italic font. (Inherited from <i>FlexContainer</i>)
<i>fontWeight</i>	whether the text is boldface. (Inherited from <i>FlexContainer</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>horizontalAlign</i>	the horizontal alignment of children in the container. (Inherited from <i>FlexBox</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>label</i>	the text displayed by some navigator containers to represent this Container. (Inherited from <i>FlexContainer</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexContainer</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numChildren</i>	the number of child components in this container. (Inherited from <i>FlexContainer</i>)
<i>numColumns</i>	the total number of columns of data available. (Inherited from <i>FlexContainer</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>FlexContainer</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)

Name	Description
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectedIndex</i>	the index of the active navigation item, where the first item is at an index of 0. The default value is -1. (Inherited from <i>FlexNavigationBar</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>verticalAlign</i>	the vertical alignment of children in the container. (Inherited from <i>FlexBox</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location

Name	Description
	on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Change	Defines the value of the type property of the event object for an <code>ItemClick</code> event. (Inherited from FlexNavigationBar)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Defines the value of the type property of the event object for a <code>dragComplete</code> event. (Inherited from FlexContainer)
DragDrop	Defines the value of the type property of the event object for a <code>dragDrop</code> event. (Inherited from FlexContainer)
DragStart	Defines the value of the type property of the event object for a <code>dragStart</code> event. (Inherited from FlexContainer)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this <code>TestObject</code> . (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. The return value is an array of rows, each of which is an array of items. (Inherited from FlexContainer)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from FlexContainer)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Scroll	Dispatched when the user manually scrolls the container. (Inherited from FlexContainer)

Name	Description
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key. (Inherited from FlexNavigationBar)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexList Class

Description

Displays a list of items horizontally, vertically, or laid out in tiles.

Inheritance Hierarchy

- [FlexListBase](#)
 - FlexList
 - [FlexTree](#)

Syntax

```
'Declaration
Public Class FlexList _
Inherits FlexListBase
```

Properties

Name	Description
allowMultipleSelection	whether you can allow more than one item to be selected at the same time. (Inherited from FlexListBase)
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
alternatingItemColors	the colors to use for the backgrounds of the items in the list. (Inherited from FlexListBase)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)

Name	Description
<i>backgroundDisabledColor</i>	the color of text in the component if it is disabled. The default value is 0xAAB3B3. (Inherited from <i>FlexListBase</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>columnCount</i>	the number of columns to be displayed in a <i>TileList</i> control or items in a <i>HorizontalList</i> control. (Inherited from <i>FlexListBase</i>)
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>FlexListBase</i>)
<i>columnWidth</i>	the width of the control's columns. (Inherited from <i>FlexListBase</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>dataTipField</i>	the name of the field in the data provider items to display as the data tip. (Inherited from <i>FlexListBase</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexListBase</i>)
<i>focusAlpha</i>	the alpha transparency value of the focus skin. The default value is 0.4. (Inherited from <i>FlexListBase</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>iconField</i>	the name of the field in the data provider object that determines what to display as the icon. (Inherited from <i>FlexListBase</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>labelField</i>	the name of the field in the data provider items to display as the label. (Inherited from <i>FlexListBase</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexListBase</i>)
<i>lockedColumnCount</i>	the index of the first column in the control that scrolls. (Inherited from <i>FlexListBase</i>)
<i>lockedRowCount</i>	the index of the first row in the control that scrolls. (Inherited from <i>FlexListBase</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any <i>InteractiveObject</i> instance that is on the display list receives mouse events. If <i>mouseEnabled</i> is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the

Name	Description
	mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>FlexListBase</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>FlexListBase</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>rollOverColor</i>	the color of the background of a renderer when the user rolls over it. The default value is 0xEEFEE6. (Inherited from <i>FlexListBase</i>)
<i>rowCount</i>	the number of rows to be displayed. (Inherited from <i>FlexListBase</i>)
<i>rowHeight</i>	the height of the rows in pixels. (Inherited from <i>FlexListBase</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectable</i>	whether the list shows selected items as selected. (Inherited from <i>FlexListBase</i>)
<i>selectedIndex</i>	the index in the data provider of the selected item. (Inherited from <i>FlexListBase</i>)
<i>selectedIndices</i>	an array of indices in the data provider of the selected items. (Inherited from <i>FlexListBase</i>)
<i>selectedItem</i>	a reference to the selected item in the data provider. (Inherited from <i>FlexListBase</i>)
<i>selectedItems</i>	an array of references to the selected items in the data provider. (Inherited from <i>FlexListBase</i>)
<i>selectionColor</i>	the color of the background of a renderer when the user selects it. The default value is 0x7FCEFF. (Inherited from <i>FlexListBase</i>)
<i>selectionDisabledColor</i>	the color of the background of a renderer when the component is disabled. The default value is 0xDDDDDD. (Inherited from <i>FlexListBase</i>)
<i>showDataTips</i>	whether dataTips are displayed for text in the rows. (Inherited from <i>FlexListBase</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)

Name	Description
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>textRollOverColor</i>	the text color of the label as the user moves the mouse pointer over the button. The default value is 0x2B333C. (Inherited from <i>FlexListBase</i>)
<i>textSelectedColor</i>	the color of the text of a renderer when the user selects it. The default value is 0x2B333C. (Inherited from <i>FlexListBase</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is <code>true</code> . If <code>useHandCursor</code> is <code>false</code> , the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>useRollOver</i>	whether items are highlighted as the mouse rolls over them. (Inherited from <i>FlexListBase</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>variableRowHeight</i>	whether the individual rows can have different height. (Inherited from <i>FlexListBase</i>)
<i>verticalAlign</i>	the vertical alignment of a renderer in a row. (Inherited from <i>FlexListBase</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>wordWrap</i>	whether text in the row should be word wrapped. (Inherited from <i>FlexListBase</i>)
<i>x</i>	the x coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored

Name	Description
	<p>in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)</p>
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
Deselect	<p>Defines the value of the type property of the event object for an event that is dispatched when a previously selected item is deselected. (Inherited from FlexListBase)</p>
DoubleClick	<p>Double-clicks a mouse button on the object. (Inherited from IClickable)</p>
DoubleClick	<p>Defines the value of the type property of the ListEvent object for an itemDoubleClick event, which indicates that the user double-clicked the mouse over a visual item in the control. (Inherited from FlexListBase)</p>
DragCancel	<p>Defines the value of the type property of the event object for a dragComplete event. (Inherited from FlexListBase)</p>
DragDrop	<p>Defines the value of the type property of the event object for a dragDrop event. (Inherited from FlexListBase)</p>
DragStart	<p>Defines the value of the type property of the event object for a dragStart event. (Inherited from FlexListBase)</p>
Edit	<p>Defines the value of the type property of the event object for a itemEditBegin event, which indicates that an item is ready to be edited.</p>
Exists	<p>Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)</p>
Exists	<p>Checks if an object exists in the application under test. (Inherited from TestObject)</p>
Find	<p>Finds an object specified by an XPath locator. (Inherited from TestObject)</p>
FindAll	<p>Finds all objects specified by an XPath locator. (Inherited from TestObject)</p>
GenerateLocator	<p>Returns a locator for this object. (Inherited from TestObject)</p>
GetChildren	<p>Returns the child objects of this object. (Inherited from TestObject)</p>
GetDynamicMethodList	<p>Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)</p>
GetParent	<p>Looks up the parent of this object in the test application. (Inherited from TestObject)</p>

Name	Description
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from FlexListBase)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from FlexScrollBase)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
MultiSelect	Defines the value of the type property of the event object for an event that is dispatched when an item is selected as part of an action that selects multiple items. (Inherited from FlexListBase)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)

Name	Description
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Scroll	Defines the value of the type property of the event object for a scroll event. (Inherited from FlexListBase)
ScrollToIndex	Ensures that the data provider item at the given index is visible. (Inherited from FlexListBase)
Select	Defines the value of the type property of the event object for an event that is dispatched when a single item is selected. (Inherited from FlexListBase)
SelectIndex	Defines the value of the type property of the event object for an event that is dispatched when a single item is selected. (Inherited from FlexListBase)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key. (Inherited from FlexListBase)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForObject	Waits for an object that matches the specified locator. If no object matches within a timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexListBase Class

Description

The `ListBase` class is the base class for controls that represent lists of items that can have one or more selected and can scroll through the items.

Items are supplied using the `dataProvider` property and displayed via item renderers.

In a model/view architecture, the `ListBase`-derived class represents the view, and the `dataProvider` object represents the model.

Inheritance Hierarchy

 - [FlexDataGrid](#)
 - [FlexList](#)

Syntax

```
'Declaration  
Public Class FlexListBase _  
Inherits FlexScrollBase
```

Properties

Name	Description
allowMultipleSelection	whether you can allow more than one item to be selected at the same time.
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
alternatingItemColors	the colors to use for the backgrounds of the items in the list.
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
backgroundDisabledColor	the color of text in the component if it is disabled. The default value is 0xAAB3B3.
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
columnCount	the number of columns to be displayed in a TileList control or items in a HorizontalList control.
columnNames	a list containing the names of all columns in the data.
columnWidth	the width of the control's columns.
currentState	the current view state of the component. (Inherited from FlexObject)
dataTipField	the name of the field in the data provider items to display as the data tip.
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from FlexObject)
firstVisibleRow	the index of the first visible child.
focusAlpha	the alpha transparency value of the focus skin. The default value is 0.4.
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from FlexObject)
height	the height of the display object, in pixels. (Inherited from FlexDisplayObject)

Name	Description
<i>iconField</i>	the name of the field in the data provider object that determines what to display as the icon.
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>labelField</i>	the name of the field in the data provider items to display as the label.
<i>lastVisibleRow</i>	the index of the last visible child.
<i>lockedColumnCount</i>	the index of the first column in the control that scrolls.
<i>lockedRowCount</i>	the index of the first row in the control that scrolls.
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available.
<i>numRows</i>	the total number of rows of data available.
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>rollOverColor</i>	the color of the background of a renderer when the user rolls over it. The default value is 0xEEFEE6.
<i>rowCount</i>	the number of rows to be displayed.
<i>rowHeight</i>	the height of the rows in pixels.
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectable</i>	whether the list shows selected items as selected.
<i>selectedIndex</i>	the index in the data provider of the selected item.
<i>selectedIndices</i>	an array of indices in the data provider of the selected items.
<i>selectedItem</i>	a reference to the selected item in the data provider.
<i>selectedItems</i>	an array of references to the selected items in the data provider.
<i>selectionColor</i>	the color of the background of a renderer when the user selects it. The default value is 0x7FCEFF.

Name	Description
<i>selectionDisabledColor</i>	the color of the background of a renderer when the component is disabled. The default value is 0xDDDDDD.
<i>showDataTips</i>	whether dataTips are displayed for text in the rows.
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>textRollOverColor</i>	the text color of the label as the user moves the mouse pointer over the button. The default value is 0x2B333C.
<i>textSelectedColor</i>	the color of the text of a renderer when the user selects it. The default value is 0x2B333C.
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>useRollOver</i>	whether items are highlighted as the mouse rolls over them.
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>variableRowHeight</i>	whether the individual rows can have different height.
<i>verticalAlign</i>	the vertical alignment of a renderer in a row.
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>wordWrap</i>	whether text in the row should be word wrapped.
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location

Name	Description
	<p>on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)</p>
<i>ChangeFocus</i>	Changes the current focus. (Inherited from <i>FlexObject</i>)
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i>)
<i>Deselect</i>	Defines the value of the type property of the event object for an event that is dispatched when a previously selected item is deselected.
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i>)
<i>DoubleClick</i>	Defines the value of the type property of the ListEvent object for an itemDoubleClick event, which indicates that the user double-clicked the mouse over a visual item in the control.
<i>DragCancel</i>	Defines the value of the type property of the event object for a dragComplete event.
<i>DragDrop</i>	Defines the value of the type property of the event object for a dragDrop event.
<i>DragStart</i>	Defines the value of the type property of the event object for a dragStart event.
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <i>TestObject</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)

Name	Description
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components.
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from FlexScrollBase)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
MultiSelect	Defines the value of the type property of the event object for an event that is dispatched when an item is selected as part of an action that selects multiple items.
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)

Name	Description
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Scroll	Defines the value of the type property of the event object for a scroll event.
ScrollToIndex	Ensures that the data provider item at the given index is visible.
Select	Defines the value of the type property of the event object for an event that is dispatched when a single item is selected.
SelectIndex	Defines the value of the type property of the event object for an event that is dispatched when a single item is selected.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a

Name	Description
	WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexListLabel Class

Description

Defines the default item renderer for a control. By default, the item renderer draws the text associated with each item in the list, and an optional icon.

Inheritance Hierarchy

- [FlexDisplayObject](#)
 - FlexListLabel

Syntax

```
'Declaration
Public Class FlexListLabel _
Inherits FlexDisplayObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element.
automationIndex	a string containing the automation index for the element.
automationName	the name that can be used as an identifier for this object.

Name	Description
automationValue	the value that generally corresponds to the rendered appearance of the object and should be usable for correlating the identifier with the object as it appears visually within the application.
className	the name of this instance's class, such as "Button".
height	the height of the display object, in pixels. (Inherited from FlexDisplayObject)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from FlexDisplayObject)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from FlexDisplayObject)
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)

Name	Description
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)

Name	Description
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForObject	Waits for an object that matches the specified locator. If no object matches within a timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexLoader Class

Description

Loads and displays a specified SWF file. You typically use `SWFLoader` for loading one Flex application into a host Flex application.

Inheritance Hierarchy

- [FlexObject](#)
 - `FlexLoader`
 - [FlexImage](#)

Syntax

```
'Declaration
Public Class FlexLoader _
Inherits FlexObject
```

Properties

Name	Description
<i>alpha</i>	the alpha transparency value of the object specified. (Inherited from <i>FlexDisplayObject</i>)
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i>)
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any <i>InteractiveObject</i> instance that is on the display list receives mouse events. If <i>mouseEnabled</i> is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the <i>mouseEnabled</i> behavior for all children of an object on the display list, use <i>flash.display.DisplayObjectContainer.mouseChildren</i> . (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or <i>explicitWidth</i> properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)

Name	Description
scaleY	the number that specifies the vertical scaling factor. (Inherited from FlexObject)
source	The URL, object, class or string name of a class to load as the content.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from FlexDisplayObject)
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TestObject)
themeColor	the theme color of a component. (Inherited from FlexObject)
toolTip	the text to display in the ToolTip. The default value is Nothing. (Inherited from FlexObject)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from FlexObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)

Name	Description
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)

Name	Description
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
WaitForObject	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject) Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexMenu Class

Description

Creates a pop-up menu of individually selectable choices, similar to the File or Edit menu found in most software applications. The popped up menu can have as many levels of submenus as needed.

Inheritance Hierarchy

- [FlexObject](#)
 - FlexMenu

Syntax

```
'Declaration
Public Class FlexMenu _
Inherits FlexObject
```

Properties

Name	Description
<i>alpha</i>	the alpha transparency value of the object specified. (Inherited from <i>FlexDisplayObject</i>)
<i>alternatingItemColors</i>	the colors used for menu or submenu menu items in an alternating pattern.
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i>)
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>columnNames</i>	a list containing the names of all columns in the data.
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child.
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>lastVisibleRow</i>	the index of the last visible child.
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any <i>InteractiveObject</i> instance that is on the display list receives mouse events. If <i>mouseEnabled</i> is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the <i>mouseEnabled</i> behavior for all children of an object on the display list, use <i>flash.display.DisplayObjectContainer.mouseChildren</i> . (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available.
<i>numRows</i>	the total number of rows of data available.

Name	Description
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>rollOverColor</i>	the color of the menu item background when a user rolls the mouse over it. The default value is 0xB2E1FF.
<i>rowCount</i>	the number of rows to be displayed.
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectedIndex</i>	the index in the data provider of the selected item.
<i>selectionColor</i>	the color of the menu item background when a menu item is selected. The default value is 0x7FCEFF.
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>textRollOverColor</i>	the color of the menu item text when a user rolls the mouse over the menu item. The default value is 0x2B333C.
<i>textSelectedColor</i>	the color of the menu item text when the menu item is selected. The default value is 0x2B333C.
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Name	Description
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components.
Hide	Dispatched when a menu or submenu is dismissed.
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Select	Dispatched when a menu item is selected.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)

Name	Description
 SetProperty 	Sets the value of the specified property. (Inherited from TestObject)
 Show 	Dispatched when a menu or submenu opens.
 TextCapture 	Returns the text in this object's visible area. (Inherited from TestObject)
 TextClick 	Clicks in the center of the specified text. (Inherited from TestObject)
 TextExists 	Returns whether the specified text exists. (Inherited from TestObject)
 TextRectangle 	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
 ToString 	Returns a string representation of the control. (Inherited from FlexDisplayObject)
 Type 	Dispatched when the user presses a key.
 TypeKeys 	Sends a set of keystrokes to the object. (Inherited from IKeyable)
 TypePasswordKeys 	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
 WaitForChildDisappearance 	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForDisappearance 	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForObject 	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
 WaitForProperty 	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForPropertyNotEquals 	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout

Name	Description
<i>WaitForScreenshotStable</i>	specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>) Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

FlexMenuBar Class

Description

Defines a horizontal, top-level menu bar that contains one or more menus. Clicking on a top-level menu item opens a pop-up submenu that is an instance of the Menu control.

Inheritance Hierarchy

- *FlexObject*
 - FlexMenuBar

Syntax

```

Public Class FlexMenuBar _
Inherits FlexObject
```

Properties

Name	Description
<i>alpha</i>	the alpha transparency value of the object specified. (Inherited from <i>FlexDisplayObject</i>)
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i>)
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>backgroundColor</i>	the background color of the component.
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>color</i>	the color of text in the component, including the component label. The default value is 0x0B333C.
<i>columnNames</i>	a list containing the names of all columns in the data.
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)

Name	Description
<i>disabledColor</i>	the color of text in the component if it is disabled. The default value is 0xAAB3B3.
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>fillColors</i>	the colors used to tint the background of the control.
<i>firstVisibleRow</i>	the index of the first visible child.
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use.
<i>fontSize</i>	the height of the text, in pixels.
<i>fontStyle</i>	whether the text is italic font.
<i>fontWeight</i>	whether the text is boldface.
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>lastVisibleRow</i>	the index of the last visible child.
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numChildren</i>	the number of children of this object.
<i>numColumns</i>	the total number of columns in the data available.
<i>numRows</i>	the total number of rows of data available.
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>rollOverColor</i>	the color of the menu item background when a user rolls the mouse over it.

Name	Description
scaleX	the number that specifies the horizontal scaling factor. (Inherited from FlexObject)
scaleY	the number that specifies the vertical scaling factor. (Inherited from FlexObject)
selectedIndex	the index in the MenuBar control of the currently open Menu or the last opened Menu if none are currently open.
selectionColor	the color of the menu item background when a menu item is selected.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from FlexDisplayObject)
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TestObject)
textAlign	the alignment of text within a container.
textDecoration	whether the text is underlined.
textIndent	the offset of the first line of text from the left side of the container, in pixels. The default value is 0.
themeColor	the theme color of a component. (Inherited from FlexObject)
toolTip	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from FlexObject)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <code>useHandCursor</code> is false, the arrow pointer is used instead. (Inherited from FlexObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/</code>

Name	Description
	Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this <code>TestObject</code> . (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components.
Hide	Dispatched when a menu or submenu is dismissed.
HighlightObject	Highlights this object. (Inherited from TestObject)

Name	Description
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
Show	Dispatched when a menu or submenu opens.
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)

Name	Description
<i>ToString</i>	Returns a string representation of the control. (Inherited from <i>FlexDisplayObject</i>)
<i>Type</i>	Dispatched when the user presses a key.
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

FlexNavigationBar Class

Description

The superclass for navigator controls, such as the LinkBar and TabBar controls. This class cannot be instantiated directly.

Inheritance Hierarchy

- [FlexBox](#)
 - FlexNavigationBar
 - [FlexButtonBar](#)
 - [FlexLinkBar](#)

Syntax

```
'Declaration
Public Class FlexNavigationBar _
Inherits FlexBox
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
backgroundAlpha	the alpha level of the color defined by the backgroundColor property, of the image or SWF file defined by the backgroundImage style. Valid values range from 0.0 to 1.0. (Inherited from FlexContainer)
backgroundColor	the background color of a component. (Inherited from FlexContainer)
backgroundDisabledColor	the background color of the component when it is disabled. The global default value is undefined. (Inherited from FlexContainer)
backgroundImage	the background image of a component. This can be an absolute or relative URL or class. (Inherited from FlexContainer)
backgroundSize	the percentage to change the image size to for the specified backgroundImage. (Inherited from FlexContainer)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
columnNames	a list containing the names of all columns in the data. (Inherited from FlexContainer)

Name	Description
<i>creationIndex</i>	the order to instantiate and draw the children of the container. (Inherited from <i>FlexContainer</i>)
<i>creationPolicy</i>	the child creation policy for this Container. (Inherited from <i>FlexContainer</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>direction</i>	whether to use vertical (default) or horizontal layout. (Inherited from <i>FlexBox</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>fillAlphas</i>	the alpha transparency values used for the background fill of components. (Inherited from <i>FlexContainer</i>)
<i>fillColors</i>	the colors used to tint the background fill of the component. (Inherited from <i>FlexContainer</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexContainer</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use. (Inherited from <i>FlexContainer</i>)
<i>fontSize</i>	the height of the text, in pixels. (Inherited from <i>FlexContainer</i>)
<i>fontStyle</i>	whether the text is italic font. (Inherited from <i>FlexContainer</i>)
<i>fontWeight</i>	whether the text is boldface. (Inherited from <i>FlexContainer</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>horizontalAlign</i>	the horizontal alignment of children in the container. (Inherited from <i>FlexBox</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>label</i>	the text displayed by some navigator containers to represent this Container. (Inherited from <i>FlexContainer</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexContainer</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)

Name	Description
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numChildren</i>	the number of child components in this container. (Inherited from <i>FlexContainer</i>)
<i>numColumns</i>	the total number of columns of data available. (Inherited from <i>FlexContainer</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>FlexContainer</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectedIndex</i>	the index of the active navigation item, where the first item is at an index of 0. The default value is -1.
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>verticalAlign</i>	the vertical alignment of children in the container. (Inherited from <i>FlexBox</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)

Name	Description
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>Change</i>	Defines the value of the type property of the event object for an itemClick event.
<i>ChangeFocus</i>	Changes the current focus. (Inherited from <i>FlexObject</i>)
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i>)
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i>)
<i>DragCancel</i>	Defines the value of the type property of the event object for a dragComplete event. (Inherited from <i>FlexContainer</i>)
<i>DragDrop</i>	Defines the value of the type property of the event object for a dragDrop event. (Inherited from <i>FlexContainer</i>)
<i>DragStart</i>	Defines the value of the type property of the event object for a dragStart event. (Inherited from <i>FlexContainer</i>)
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
GetParent	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
GetProperty	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <i>FlexDisplayObject</i>)
GetValues	Returns a matrix containing the automation values of all parts of the components. The return value is an array of rows, each of which is an array of items. (Inherited from <i>FlexContainer</i>)
HighlightObject	Highlights this object. (Inherited from <i>TestObject</i>)
ImageClick	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
ImageClickFile	Clicks on the specified image. (Inherited from <i>TestObject</i>)
ImageExists	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
ImageExistsFile	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
Invoke	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
InvokeMethods	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
MouseScroll	Dispatched when a mouse wheel is spun over an <i>InteractiveObject</i> instance. (Inherited from <i>FlexContainer</i>)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <i>FlexObject</i>)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Scroll	Dispatched when the user manually scrolls the container. (Inherited from FlexContainer)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider

Name	Description
	increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexNumericStepper Class

Description

Lets the user select a number from an ordered set.

The NumericStepper control consists of a single-line input text field and a pair of arrow buttons for stepping through the possible values. The Up Arrow and Down Arrow keys also cycle through the values.

Inheritance Hierarchy

- [FlexObject](#)
 - FlexNumericStepper

Syntax

```
'Declaration
Public Class FlexNumericStepper _
Inherits FlexObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)

Name	Description
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>color</i>	the color of text in the component, including the component label. The default value is 0x0B333C.
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>disabledColor</i>	the color of text in the component if it is disabled. The default value is 0xAAB3B3.
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>fillColors</i>	the colors used to tint the background of the control. Pass the same color for both values for a flat-looking control. The default value is [0xFFFFFFFF, 0xC0C0C0].
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use.
<i>fontSize</i>	the height of the text, in pixels.
<i>fontStyle</i>	whether the text is italic font.
<i>fontWeight</i>	whether the text is boldface. Recognized values are normal and bold.
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>maximum</i>	the maximum value of the NumericStepper.
<i>minimum</i>	the minimum value of the NumericStepper.
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>nextValue</i>	the value that is one step larger than the current value property and not greater than the maximum property value.

Name	Description
numAutomationChildren	the number of automation children this container has. (Inherited from FlexObject)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from FlexObject)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from FlexObject)
previousValue	the value that is one step smaller than the current value property and not smaller than the maximum property value.
scaleX	the number that specifies the horizontal scaling factor. (Inherited from FlexObject)
scaleY	the number that specifies the vertical scaling factor. (Inherited from FlexObject)
stepSize	the non-zero unit of change between values.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from FlexDisplayObject)
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TestObject)
textAlign	the alignment of text within a container. Possible values are: left, right, or center.
textDecoration	whether the text is underlined. Possible values are <i>none</i> and <i>underline</i> . The default value is <i>none</i> .
textIndent	the offset of first line of text from the left side of the container, in pixels. The default value is 0.
themeColor	the theme color of a component. (Inherited from FlexObject)
toolTip	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from FlexObject)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from FlexObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
value	the value displayed in the text area of the NumericStepper control.
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)

Name	Description
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>Change</i>	Dispatched when the value of the NumericStepper control changes as a result of user interaction.
<i>ChangeFocus</i>	Changes the current focus. (Inherited from <i>FlexObject</i>)
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i>)
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i>)
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <i>TestObject</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)

Name	Description
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Input	Creates an Event object that contains information about text events. Event objects are passed as parameters to event listeners.
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SelectText	Lets you track selection within a text field.

Name	Description
<i>SetFocus</i>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <i>FlexObject</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>ToString</i>	Returns a string representation of the control. (Inherited from <i>FlexDisplayObject</i>)
<i>Type</i>	Dispatched when the user presses a key.
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly

Name	Description
	pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexObject Class

Description

The base class for all visual components, both interactive and noninteractive.

Syntax

```
'Declaration  
Public Class FlexObject _  
Inherits FlexDisplayObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element.
automationIndex	a string containing the automation index for the element.
automationName	the name that can be used as an identifier for this object.
className	the name of this instance's class, such as <i>Button</i> .
currentState	the current view state of the component.
enabled	whether the component can accept user interaction.
errorColor	the color of the component highlight when validation fails.
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails.
focusEnabled	whether the component can receive focus when tabbed to.
height	the height of the display object, in pixels. (Inherited from FlexDisplayObject)
id	the ID of the component.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from FlexDisplayObject)
numAutomationChildren	the number of automation children this container has.
percentHeight	the number that specifies the height of a component as a percentage of its parent's size.
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN.
scaleX	the number that specifies the horizontal scaling factor.
scaleY	the number that specifies the vertical scaling factor.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from FlexDisplayObject)
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)

Name	Description
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TestObject)
themeColor	the theme color of a component.
toolTip	the text to display in the ToolTip. The default value is <code>Nothing</code> .
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is <code>true</code> . If <code>useHandCursor</code> is <code>false</code> , the arrow pointer is used instead.
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from FlexDisplayObject)
y	the y coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus.
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)

Name	Description
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)

Name	Description
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties.
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent.
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a

Name	Description
	WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexOLAPDataGrid Class

Description

Expands on the functionality of the AdvancedDataGrid control to add support for the display of the results of OLAP queries.

Like all Flex data grid controls, the OLAPDataGrid control is designed to display data in a two-dimensional representation of rows and columns.

Inheritance Hierarchy

- [FlexAdvancedDataGrid](#)
 - FlexOLAPDataGrid

Syntax

```
'Declaration
Public Class FlexOLAPDataGrid _
Inherits FlexAdvancedDataGrid
```

Properties

Name	Description
allowDragSelection	whether drag-selection is enabled. Drag-Selection is the ability to select an item by dragging into it as opposed to normal selection where you can't have the mouse button down when you mouse over

Name	Description
	the item you want to select. (Inherited from <i>FlexAdvancedDataGrid</i>)
<i>allowMultipleSelection</i>	whether you can allow more than one item to be selected at the same time. (Inherited from <i>FlexListBase</i>)
<i>alpha</i>	the alpha transparency value of the object specified. (Inherited from <i>FlexDisplayObject</i>)
<i>alternatingItemColors</i>	the colors to use for the backgrounds of the items in the list. (Inherited from <i>FlexListBase</i>)
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i>)
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>backgroundDisabledColor</i>	the color of text in the component if it is disabled. The default value is 0xAAB3B3. (Inherited from <i>FlexListBase</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>columnCount</i>	the number of columns to be displayed in a <i>TileList</i> control or items in a <i>HorizontalList</i> control. (Inherited from <i>FlexListBase</i>)
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>FlexListBase</i>)
<i>columnWidth</i>	the width of the control's columns. (Inherited from <i>FlexListBase</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>dataTipField</i>	the name of the field in the data provider items to display as the data tip. (Inherited from <i>FlexListBase</i>)
<i>defaultCellString</i>	the String displayed in a cell when the data for that cell returned by the <i>IOLAPResult</i> instance is <i>Nothing</i> or <i>NaN</i> .
<i>depthColors</i>	the array of colors used for the rows of each level of the navigation tree of the <i>AdvancedDataGrid</i> control, in descending order. The default value is undefined. (Inherited from <i>FlexAdvancedDataGrid</i>)
<i>disabledColor</i>	the color of text in the component if it is disabled. (Inherited from <i>FlexAdvancedDataGrid</i>)
<i>displayItemsExpanded</i>	whether the navigation tree is expanded to show all items. (Inherited from <i>FlexAdvancedDataGrid</i>)
<i>editable</i>	whether the user can edit items in the data provider. (Inherited from <i>FlexAdvancedDataGrid</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)

Name	Description
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexListBase</i>)
<i>focusAlpha</i>	the alpha transparency value of the focus skin. The default value is 0.4. (Inherited from <i>FlexListBase</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>headerColors</i>	an array of two colors used to draw the header background gradient. (Inherited from <i>FlexAdvancedDataGrid</i>)
<i>headerHeight</i>	the height of the header cell of the column, in pixels. (Inherited from <i>FlexAdvancedDataGrid</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>horizontalGridLineColor</i>	the color of the horizontal grid lines. (Inherited from <i>FlexAdvancedDataGrid</i>)
<i>iconField</i>	the name of the field in the data provider object that determines what to display as the icon. (Inherited from <i>FlexListBase</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>indentation</i>	the indentation for each node of the navigation tree, in pixels. The default value is 17. (Inherited from <i>FlexAdvancedDataGrid</i>)
<i>labelField</i>	the name of the field in the data provider items to display as the label. (Inherited from <i>FlexListBase</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexListBase</i>)
<i>lockedColumnCount</i>	the index of the first column in the control that scrolls. (Inherited from <i>FlexListBase</i>)
<i>lockedRowCount</i>	the index of the first row in the control that scrolls. (Inherited from <i>FlexListBase</i>)
<i>minColumnWidth</i>	the minimum width of the columns, in pixels. (Inherited from <i>FlexAdvancedDataGrid</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)

Name	Description
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>FlexListBase</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>FlexListBase</i>)
<i>openDuration</i>	the length of an open or close transition for the navigation tree, in milliseconds. The default value is 250. (Inherited from <i>FlexAdvancedDataGrid</i>)
<i>paddingBottom</i>	the number of pixels between the bottom of the row and the bottom of the renderer in the row. (Inherited from <i>FlexAdvancedDataGrid</i>)
<i>paddingLeft</i>	the number of pixels between the control's left border and the left edge of its content area. The default value is 2. (Inherited from <i>FlexAdvancedDataGrid</i>)
<i>paddingRight</i>	the number of pixels between the control's right border and the right edge of its content area. The default value is 0. (Inherited from <i>FlexAdvancedDataGrid</i>)
<i>paddingTop</i>	the number of pixels between the top of the row and the top of the renderer in the row. (Inherited from <i>FlexAdvancedDataGrid</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>resizableColumns</i>	whether the user can change the size of the columns. (Inherited from <i>FlexAdvancedDataGrid</i>)
<i>rollOverColor</i>	the color of the background of a renderer when the user rolls over it. The default value is 0xEEFEE6. (Inherited from <i>FlexListBase</i>)
<i>rowCount</i>	the number of rows to be displayed. (Inherited from <i>FlexListBase</i>)
<i>rowHeight</i>	the height of the rows in pixels. (Inherited from <i>FlexListBase</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectable</i>	whether the list shows selected items as selected. (Inherited from <i>FlexListBase</i>)
<i>selectedCells</i>	an Array of cell locations as row and column indices. (Inherited from <i>FlexAdvancedDataGrid</i>)
<i>selectedIndex</i>	the index in the data provider of the selected item. (Inherited from <i>FlexListBase</i>)
<i>selectedIndices</i>	an array of indices in the data provider of the selected items. (Inherited from <i>FlexListBase</i>)

Name	Description
<i>selectedItem</i>	a reference to the selected item in the data provider. (Inherited from <i>FlexListBase</i>)
<i>selectedItems</i>	an array of references to the selected items in the data provider. (Inherited from <i>FlexListBase</i>)
<i>selectionColor</i>	the color of the background of a renderer when the user selects it. The default value is 0x7FCEFF. (Inherited from <i>FlexListBase</i>)
<i>selectionDisabledColor</i>	the color of the background of a renderer when the component is disabled. The default value is 0xDDDDDD. (Inherited from <i>FlexListBase</i>)
<i>selectionMode</i>	the selection mode of the control. (Inherited from <i>FlexAdvancedDataGrid</i>)
<i>showDataTips</i>	whether dataTips are displayed for text in the rows. (Inherited from <i>FlexListBase</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>textRollOverColor</i>	the text color of the label as the user moves the mouse pointer over the button. The default value is 0x2B333C. (Inherited from <i>FlexListBase</i>)
<i>textSelectedColor</i>	the color of the text of a renderer when the user selects it. The default value is 0x2B333C. (Inherited from <i>FlexListBase</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>useRollOver</i>	whether items are highlighted as the mouse rolls over them. (Inherited from <i>FlexListBase</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>variableRowHeight</i>	whether the individual rows can have different height. (Inherited from <i>FlexListBase</i>)
<i>verticalAlign</i>	the vertical alignment of a renderer in a row. (Inherited from <i>FlexListBase</i>)
<i>verticalGridLineColor</i>	the color of the vertical grid lines. The default value is 0x666666. (Inherited from <i>FlexAdvancedDataGrid</i>)

Name	Description
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>wordWrap</i>	whether text in the row should be word wrapped. (Inherited from <i>FlexListBase</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>ChangeFocus</i>	Changes the current focus. (Inherited from <i>FlexObject</i>)
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i>)
<i>Close</i>	Closes or collapses a AdvancedDataGrid branch. (Inherited from <i>FlexAdvancedDataGrid</i>)
<i>ColumnGroupedADGHeaderShift</i>	Dispatched when the user releases the mouse button on a column header after having dragged the column to a new location resulting in shifting the column to a new index. (Inherited from <i>FlexAdvancedDataGrid</i>)
<i>ColumnStretch</i>	Dispatched when a user changes the width of a column, indicating that the amount of data displayed in that column may have changed. (Inherited from <i>FlexAdvancedDataGrid</i>)
<i>Deselect</i>	Defines the value of the type property of the event object for an event that is dispatched when a previously selected item is deselected. (Inherited from <i>FlexListBase</i>)
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i>)
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i>)
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i>)
<i>DoubleSelect</i>	Defines the value of the type property of the ListEvent object for an itemDoubleClick event, which indicates that the user double-clicked the mouse over a visual item in the control. (Inherited from <i>FlexListBase</i>)

Name	Description
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from FlexListBase)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from FlexListBase)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from FlexListBase)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetCellData	Returns data for a cell in the grid. (Inherited from FlexAdvancedDataGrid)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetGroupedItemChildrenCount	Returns the number of children within the first item of a group. (Inherited from FlexAdvancedDataGrid)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetRowData	Returns data for the row of the item in the data provider. (Inherited from FlexAdvancedDataGrid)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from FlexListBase)

Name	Description
HeaderClick	Dispatched when the user releases the mouse button on a column header to request the control to sort the grid contents based on the contents of the column. (Inherited from FlexAdvancedDataGrid)
HeaderShift	Dispatched when the user releases the mouse button on a column header after having dragged the column to a new location resulting in shifting the column to a new index. (Inherited from FlexAdvancedDataGrid)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsGroupedItem	Returns a value that specifies whether the item is a member of a group. (Inherited from FlexAdvancedDataGrid)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from FlexScrollBase)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
MultiSelect	Defines the value of the type property of the event object for an event that is dispatched when an item is selected as part of an action that selects multiple items. (Inherited from FlexListBase)
Open	Opens or expands an AdvancedDataGrid branch. (Inherited from FlexAdvancedDataGrid)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)

Name	Description
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Scroll	Defines the value of the type property of the event object for a scroll event. (Inherited from FlexListBase)
ScrollToIndex	Ensures that the data provider item at the given index is visible. (Inherited from FlexListBase)
Select	Defines the value of the type property of the event object for an event that is dispatched when a single item is selected. (Inherited from FlexListBase)
SelectIndex	Defines the value of the type property of the event object for an event that is dispatched when a single item is selected. (Inherited from FlexListBase)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key. (Inherited from FlexListBase)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by

Name	Description
	setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexPanel Class

Description

Consists of a title bar, a caption, a border, and a content area for its children.

Typically, you use Panel containers to wrap top-level application modules. For example, you can include a shopping cart in a Panel container.

Inheritance Hierarchy

- [FlexContainer](#)
 - FlexPanel
 - [FlexAlert](#)
 - [FlexTitleWindow](#)

Syntax

```
'Declaration
Public Class FlexPanel _
Inherits FlexContainer
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
backgroundAlpha	the alpha level of the color defined by the backgroundColor property, of the image or SWF file defined by the backgroundImage style. Valid values range from 0.0 to 1.0. (Inherited from FlexContainer)
backgroundColor	the background color of a component. (Inherited from FlexContainer)
backgroundDisabledColor	the background color of the component when it is disabled. The global default value is undefined. (Inherited from FlexContainer)
backgroundImage	the background image of a component. This can be an absolute or relative URL or class. (Inherited from FlexContainer)
backgroundSize	the percentage to change the image size to for the specified backgroundImage . (Inherited from FlexContainer)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
columnNames	a list containing the names of all columns in the data. (Inherited from FlexContainer)
creationIndex	the order to instantiate and draw the children of the container. (Inherited from FlexContainer)
creationPolicy	the child creation policy for this Container. (Inherited from FlexContainer)
currentState	the current view state of the component. (Inherited from FlexObject)
dropShadowEnabled	whether the Panel container's drop shadow is visible. The default value is true.
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from FlexObject)
fillAlphas	the alpha transparency values used for the background fill of components. (Inherited from FlexContainer)
fillColors	the colors used to tint the background fill of the component. (Inherited from FlexContainer)

Name	Description
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexContainer</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use. (Inherited from <i>FlexContainer</i>)
<i>fontSize</i>	the height of the text, in pixels. (Inherited from <i>FlexContainer</i>)
<i>fontStyle</i>	whether the text is italic font. (Inherited from <i>FlexContainer</i>)
<i>fontWeight</i>	whether the text is boldface. (Inherited from <i>FlexContainer</i>)
<i>footerColors</i>	the array of two colors used to draw the footer (area for the ControlBar container) background.
<i>headerColors</i>	the array of two colors used to draw the header.
<i>headerHeight</i>	the height of the header. The default value is based on the style of the title text.
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>label</i>	the text displayed by some navigator containers to represent this Container. (Inherited from <i>FlexContainer</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexContainer</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numChildren</i>	the number of child components in this container. (Inherited from <i>FlexContainer</i>)
<i>numColumns</i>	the total number of columns of data available. (Inherited from <i>FlexContainer</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>FlexContainer</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)

Name	Description
scaleY	the number that specifies the vertical scaling factor. (Inherited from FlexObject)
status	the text in the status area of the title bar. The default value is "".
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from FlexDisplayObject)
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TestObject)
themeColor	the theme color of a component. (Inherited from FlexObject)
title	the title or caption displayed in the title bar. The default value is "".
toolTip	the text to display in the ToolTip. The default value is Nothing. (Inherited from FlexObject)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from FlexObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)

Name	Description
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from FlexContainer)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from FlexContainer)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from FlexContainer)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. The return value is an array of rows, each of which is an array of items. (Inherited from FlexContainer)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)

Name	Description
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>MouseScroll</i>	Dispatched when a mouse wheel is spun over an <i>InteractiveObject</i> instance. (Inherited from <i>FlexContainer</i>)
<i>Move</i>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <i>FlexObject</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>Scroll</i>	Dispatched when the user manually scrolls the container. (Inherited from <i>FlexContainer</i>)
<i>SetFocus</i>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <i>FlexObject</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)

Name	Description
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexPieChart Class

Description

Represents a data series as a standard pie chart.

The data for the data provider determines the size of each wedge in the pie chart relative to the other wedges. You can use the `PieSeries` class to create standard pie charts, doughnut charts, or stacked pie charts.

Inheritance Hierarchy

- [FlexChart](#)
 - FlexPieChart

Syntax

```
'Declaration
Public Class FlexPieChart _
Inherits FlexChart
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
clipContent	whether Flex clips the chart to the area bounded by the axes. Set to false to clip the chart. Set to true to avoid clipping when the data is rendered. (Inherited from FlexChart)
columnNames	a list containing the names of all columns in the data. (Inherited from FlexChart)
currentState	the current view state of the component. (Inherited from FlexObject)
dataTipMode	how Flex displays DataTip controls for the chart. (Inherited from FlexChart)
description	a short description of the data in the chart. (Inherited from FlexChart)
dragEnabled	whether you can drag items out of this chart and drop them on other controls. (Inherited from FlexChart)
dropEnabled	whether dragged items can be dropped onto the chart. (Inherited from FlexChart)
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)

Name	Description
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexChart</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use. (Inherited from <i>FlexChart</i>)
<i>fontSize</i>	the height of the text, in pixels. The default value is 10 for all controls except the ColorPicker control. For the ColorPicker control, the default value is 11. (Inherited from <i>FlexChart</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>innerRadius</i>	the size of the hole in the center of the pie chart.
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexChart</i>)
<i>maximumDataTipCount</i>	the maximum number of datatips a chart will show. (Inherited from <i>FlexChart</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>mouseSensitivity</i>	the distance, in pixels, that Flex considers a data point to be under the mouse pointer when the pointer moves around a chart. (Inherited from <i>FlexChart</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>FlexChart</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>FlexChart</i>)
<i>paddingBottom</i>	the number of pixels between the chart's bottom border and its content area. (Inherited from <i>FlexChart</i>)
<i>paddingLeft</i>	the number of pixels between the control's left border and the left edge of its content area. The default value is 2. (Inherited from <i>FlexChart</i>)
<i>paddingRight</i>	the number of pixels between the control's right border and the right edge of its content area. The default value is 0. (Inherited from <i>FlexChart</i>)

Name	Description
<i>paddingTop</i>	the number of pixels between the chart's top border and its content area. (Inherited from <i>FlexChart</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectedChartItem</i>	the selected ChartItem in the chart. If multiple items are selected, this property specifies the most recently selected item. (Inherited from <i>FlexChart</i>)
<i>selectedChartItems</i>	an array of all the selected ChartItem objects in the chart. (Inherited from <i>FlexChart</i>)
<i>selectionMode</i>	whether ChartItem objects can be selected. (Inherited from <i>FlexChart</i>)
<i>showDataTips</i>	whether DataTip controls for the chart show. (Inherited from <i>FlexChart</i>)
<i>showDataTipTargets</i>	whether to show targets over the datapoints when showDataTips is set to true. (Inherited from <i>FlexChart</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>textAlign</i>	the alignment of text within a container.
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)

Name	Description
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>ChangeFocus</i>	Changes the current focus. (Inherited from <i>FlexObject</i>)
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i>)
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i>)
<i>DragCancel</i>	Defines the value of the type property of the event object for a dragComplete event. (Inherited from <i>FlexChart</i>)
<i>DragDrop</i>	Defines the value of the type property of the event object for a dragDrop event. (Inherited from <i>FlexChart</i>)
<i>DragStart</i>	Defines the value of the type property of the event object for a dragStart event. (Inherited from <i>FlexChart</i>)
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from FlexChart)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)

Name	Description
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Select	Defines the value of the type property of the event object for a headerRelease event, which indicates that the user pressed and released the mouse on a column header. (Inherited from FlexChart)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)

Name	Description
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexPieSeries Class

Description

Defines the data series for a PieChart control.

Inheritance Hierarchy

- [FlexChartSeries](#)
 - FlexPieSeries

Syntax

```
'Declaration
Public Class FlexPieSeries _
Inherits FlexChartSeries
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
calloutGap	how much space, in pixels, to insert between the edge of the pie and the labels when rendering callouts. The default value is 10.

Name	Description
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>FlexChartSeries</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>explodeRadius</i>	a number from 0 to 1, specifying how far all wedges of the pie series should be exploded from the center of the chart as a percentage of the total radius.
<i>field</i>	the field of the data provider that determines the data for each wedge of the PieChart control. The default value is <i>Nothing</i> .
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexChartSeries</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontSize</i>	the height of the text, in pixels.
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>innerRadius</i>	a number from 0 to 1 specifying the distance from the center of the series to the inner edge of the rendered wedges, as a percentage of the total radius assigned to the series.
<i>insideLabelSizeLimit</i>	the font size threshold, in points, below which inside labels are considered illegible.
<i>labelPosition</i>	how to render value labels.
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexChartSeries</i>)
<i>maxLabelRadius</i>	the maximum amount of the PieSeries's radius that can be allocated to labels.
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is <i>true</i> , which means that by default any <i>InteractiveObject</i> instance that is on the display list receives mouse events. If <i>mouseEnabled</i> is set to <i>false</i> , the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the <i>mouseEnabled</i> behavior for all children of an object on the display list, use <i>flash.display.DisplayObjectContainer.mouseChildren</i> . (Inherited from <i>FlexDisplayObject</i>)

Name	Description
nameField	the field of the data provider that determines the name of each wedge of the PieChart control. The default value is <code>Nothing</code> .
numAutomationChildren	the number of automation children this container has. (Inherited from FlexObject)
numColumns	the total number of columns in the data available. (Inherited from FlexChartSeries)
numRows	the total number of rows of data available. (Inherited from FlexChartSeries)
outerRadius	the percentage of the total space available to the PieSeries to use when rendering the contents of the series.
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from FlexObject)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from FlexObject)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from FlexObject)
scaleY	the number that specifies the vertical scaling factor. (Inherited from FlexObject)
selectedIndex	the index of the selected item in the data provider of the series. (Inherited from FlexChartSeries)
selectedIndices	an array of indexes of the selected items in the data provider of the series. (Inherited from FlexChartSeries)
selectedItem	the chart item that is selected in the series. (Inherited from FlexChartSeries)
selectedItems	an array of chart items that are selected in the series. (Inherited from FlexChartSeries)
startAngle	the starting angle for the first slice of the PieChart control.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from FlexDisplayObject)
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TextObject)
themeColor	the theme color of a component. (Inherited from FlexObject)
toolTip	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from FlexObject)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from FlexObject)

Name	Description
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>ChangeFocus</i>	Changes the current focus. (Inherited from <i>FlexObject</i>)
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i>)
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i>)
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from FlexChartSeries)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)

Name	Description
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SeriesClick	Indicates that the user clicked the mouse button over a chart item representing data in the chart. (Inherited from FlexChartSeries)
SeriesDoubleClick	Indicates that the user double-clicked the mouse button over a chart item representing data in the chart. (Inherited from FlexChartSeries)
SeriesItemRollOver	Indicates that the user rolled the mouse pointer over a chart item representing data in the chart. (Inherited from FlexChartSeries)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive

Name	Description
	random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexPlotChart Class

Description

Represents data with two values for each data point. One value determines the position of the data point along the horizontal axis, and one value determines its position along the vertical axis.

Inheritance Hierarchy

- [FlexCartesianChart](#)
 - FlexPlotChart

Syntax

```
'Declaration
Public Class FlexPlotChart _
Inherits FlexCartesianChart
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)

Name	Description
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>clipContent</i>	whether Flex clips the chart to the area bounded by the axes. Set to false to clip the chart. Set to true to avoid clipping when the data is rendered. (Inherited from <i>FlexChart</i>)
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>FlexChart</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>dataTipMode</i>	how Flex displays DataTip controls for the chart. (Inherited from <i>FlexChart</i>)
<i>description</i>	a short description of the data in the chart. (Inherited from <i>FlexChart</i>)
<i>dragEnabled</i>	whether you can drag items out of this chart and drop them on other controls. (Inherited from <i>FlexChart</i>)
<i>dropEnabled</i>	whether dragged items can be dropped onto the chart. (Inherited from <i>FlexChart</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexChart</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use. (Inherited from <i>FlexChart</i>)
<i>fontSize</i>	the height of the text, in pixels. The default value is 10 for all controls except the ColorPicker control. For the ColorPicker control, the default value is 11. (Inherited from <i>FlexChart</i>)
<i>gutterBottom</i>	The size of the region, in pixels, between the bottom of the chart data area and the bottom of the chart control. (Inherited from <i>FlexCartesianChart</i>)
<i>gutterLeft</i>	The size of the region, in pixels, between the left of the chart data area and the left of the chart control. (Inherited from <i>FlexCartesianChart</i>)
<i>gutterRight</i>	The size of the region, in pixels, between the right side of the chart data area and the outside of the chart control. (Inherited from <i>FlexCartesianChart</i>)

Name	Description
<i>gutterTop</i>	The size of the region, in pixels, between the top of the chart data area and the top of the chart control. (Inherited from <i>FlexCartesianChart</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>horizontalAxisRatio</i>	the height limit of the horizontal axis. (Inherited from <i>FlexCartesianChart</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexChart</i>)
<i>maximumDataTipCount</i>	the maximum number of datatips a chart will show. (Inherited from <i>FlexChart</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>mouseSensitivity</i>	the distance, in pixels, that Flex considers a data point to be under the mouse pointer when the pointer moves around a chart. (Inherited from <i>FlexChart</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>FlexChart</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>FlexChart</i>)
<i>paddingBottom</i>	the number of pixels between the chart's bottom border and its content area. (Inherited from <i>FlexChart</i>)
<i>paddingLeft</i>	the number of pixels between the control's left border and the left edge of its content area. The default value is 2. (Inherited from <i>FlexChart</i>)
<i>paddingRight</i>	the number of pixels between the control's right border and the right edge of its content area. The default value is 0. (Inherited from <i>FlexChart</i>)
<i>paddingTop</i>	the number of pixels between the chart's top border and its content area. (Inherited from <i>FlexChart</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)

Name	Description
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectedChartItem</i>	the selected ChartItem in the chart. If multiple items are selected, this property specifies the most recently selected item. (Inherited from <i>FlexChart</i>)
<i>selectedChartItems</i>	an array of all the selected ChartItem objects in the chart. (Inherited from <i>FlexChart</i>)
<i>selectionMode</i>	whether ChartItem objects can be selected. (Inherited from <i>FlexChart</i>)
<i>showDataTips</i>	whether DataTip controls for the chart show. (Inherited from <i>FlexChart</i>)
<i>showDataTipTargets</i>	whether to show targets over the datapoints when showDataTips is set to true. (Inherited from <i>FlexChart</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>textAlign</i>	the alignment of text within a container. (Inherited from <i>FlexCartesianChart</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>verticalAxisRatio</i>	the width limit of the vertical axis. (Inherited from <i>FlexCartesianChart</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Name	Description
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from FlexChart)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from FlexChart)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from FlexChart)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)

Name	Description
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from FlexChart)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)

Name	Description
Select	Defines the value of the type property of the event object for a headerRelease event, which indicates that the user pressed and released the mouse on a column header. (Inherited from FlexChart)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
WaitForPropertyNotEquals	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexPlotSeries Class

Description

Defines a data series for a PlotChart control.

Inheritance Hierarchy

- [FlexChartSeries](#)
 - FlexPlotSeries

Syntax

```
'Declaration
Public Class FlexPlotSeries _
Inherits FlexChartSeries
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
columnNames	a list containing the names of all columns in the data. (Inherited from FlexChartSeries)

Name	Description
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexChartSeries</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexChartSeries</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>FlexChartSeries</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>FlexChartSeries</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>radius</i>	the radius style
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)

Name	Description
selectedIndex	the index of the selected item in the data provider of the series. (Inherited from FlexChartSeries)
selectedIndices	an array of indexes of the selected items in the data provider of the series. (Inherited from FlexChartSeries)
selectedItem	the chart item that is selected in the series. (Inherited from FlexChartSeries)
selectedItems	an array of chart items that are selected in the series. (Inherited from FlexChartSeries)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from FlexDisplayObject)
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TestObject)
themeColor	the theme color of a component. (Inherited from FlexObject)
toolTip	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from FlexObject)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <code>useHandCursor</code> is false, the arrow pointer is used instead. (Inherited from FlexObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from FlexDisplayObject)
xField	the field of the data provider that determines the x-axis location of each data point.
y	the y coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from FlexDisplayObject)
yField	the field of the data provider that determines the y-axis location of each data point.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location

Name	Description
	<p>on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)</p>
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject . (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from FlexChartSeries)
HighlightObject	Highlights this object. (Inherited from TestObject)

Name	Description
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SeriesClick	Indicates that the user clicked the mouse button over a chart item representing data in the chart. (Inherited from FlexChartSeries)
SeriesDoubleClick	Indicates that the user double-clicked the mouse button over a chart item representing data in the chart. (Inherited from FlexChartSeries)
SeriesItemRollOver	Indicates that the user rolled the mouse pointer over a chart item representing data in the chart. (Inherited from FlexChartSeries)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)

Name	Description
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexPopUpButton Class

Description

The PopUpButton control adds a flexible pop-up control interface to a Button control. It contains a main button and a secondary button, called the pop-up button, which pops up any UIComponent object when a user clicks the pop-up button.

A PopUpButton control can have a text label, an icon, or both on its face. When a user clicks the main part of the PopUpButton control, it dispatches a click event.

One common use for the PopUpButton control is to have the pop-up button open a List control or a Menu control that changes the function and label of the main button.

Inheritance Hierarchy

 - FlexPopUpButton

Syntax

```
'Declaration
Public Class FlexPopUpButton _
Inherits FlexButton
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
color	the color of text in the component, including the component label. The default value is 0x0B333C. (Inherited from FlexButton)
currentState	the current view state of the component. (Inherited from FlexObject)
disabledColor	the color of text in the component if it is disabled. The default value is 0xAAB3B3. (Inherited from FlexButton)

Name	Description
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>fillAlphas</i>	the alphas used for the background fill of controls. (Inherited from <i>FlexButton</i>)
<i>fillColors</i>	the colors used to tint the background of the control. (Inherited from <i>FlexButton</i>)
<i>focusAlpha</i>	the alpha transparency value of the focus skin. The default value is 0.4. (Inherited from <i>FlexButton</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use. (Inherited from <i>FlexButton</i>)
<i>fontSize</i>	the height of the text, in pixels. (Inherited from <i>FlexButton</i>)
<i>fontStyle</i>	whether the text is italic font. (Inherited from <i>FlexButton</i>)
<i>fontWeight</i>	whether the text is boldface. (Inherited from <i>FlexButton</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>label</i>	the text to appear on the Button control. (Inherited from <i>FlexButton</i>)
<i>labelPlacement</i>	the orientation of the label in relation to a specified icon. (Inherited from <i>FlexButton</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)

Name	Description
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selected</i>	whether a toggle button is toggled on (true) or off (false). (Inherited from <i>FlexButton</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>textAlign</i>	the alignment of text within a container. (Inherited from <i>FlexButton</i>)
<i>textDecoration</i>	whether the text is underlined. (Inherited from <i>FlexButton</i>)
<i>textIndent</i>	the offset of the first line of text from the left side of the container, in pixels. The default value is 0. (Inherited from <i>FlexButton</i>)
<i>textRollOverColor</i>	the text color of the label as the user moves the mouse pointer over the button. The default value is 0x2B333C. (Inherited from <i>FlexButton</i>)
<i>textSelectedColor</i>	the text color of the label as the user presses it. The default value is 0x000000. (Inherited from <i>FlexButton</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toggle</i>	whether a Button is in a toggle state or not. (Inherited from <i>FlexButton</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is <i>Nothing</i> . (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <i>useHandCursor</i> is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Name	Description
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
Close	Dispatched when the specified UIComponent closes.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
Open	Dispatched when the specified UIComponent opens.
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)

Name	Description
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key. (Inherited from FlexButton)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If

Name	Description
	you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexProgressBar Class

Description

The `ProgressBar` control provides a visual representation of the progress of a task over time. There are two types of `ProgressBar` controls: determinate and indeterminate.

A determinate `ProgressBar` control is a linear representation of the progress of a task over time. You use a determinate `ProgressBar` when the scope of the task is known. It displays when the user has to wait for an extended amount of time.

An indeterminate `ProgressBar` control represents time-based processes for which the scope is not yet known. As soon as you can determine the scope, you should use a determinate `ProgressBar` control.

Inheritance Hierarchy

- [FlexObject](#)
 - `FlexProgressBar`

Syntax

```
'Declaration
Public Class FlexProgressBar _
Inherits FlexObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
barColor	the color of a <code>ProgressBar</code> .
borderColor	the black section of a three-dimensional border, or the color section of a two-dimensional border. The default value is <code>0xB7BABC</code> .
className	the name of this instance's class, such as <code>Button</code> . (Inherited from FlexObject)
color	the color of text in the component, including the component label. The default value is <code>0x0B333C</code> .

Name	Description
<i>conversion</i>	the number used to convert incoming current bytes loaded value and the total bytes loaded values.
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>direction</i>	the direction in which the fill of the ProgressBar expands toward completion. Valid values in MXML are "right" and "left".
<i>disabledColor</i>	the color of text in the component if it is disabled. The default value is 0xAAB3B3.
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>fillColors</i>	the colors used to tint the background fill of the component.
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use.
<i>fontSize</i>	the height of the text, in pixels.
<i>fontStyle</i>	whether the text is italic font.
<i>fontWeight</i>	whether the text is boldface.
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>indeterminate</i>	whether the ProgressBar control has a determinate or indeterminate appearance.
<i>label</i>	the text that accompanies the progress bar.
<i>labelPlacement</i>	the placement of the label.
<i>labelWidth</i>	the width of the label in pixels.
<i>maximum</i>	the largest progress value for the ProgressBar. You can only use this property in manual mode.
<i>minimum</i>	the smallest progress value for the ProgressBar. This property is set by the developer only in manual mode.
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use <code>flash.display.DisplayObjectContainer.mouseChildren</code> . (Inherited from <i>FlexDisplayObject</i>)

Name	Description
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>percentComplete</i>	the percentage of process that is completed. The range is 0 to 100.
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or <i>explicitWidth</i> properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>textAlign</i>	the alignment of text within a container.
<i>textDecoration</i>	whether the text is underlined.
<i>textIndent</i>	the offset of first line of text from the left side of the container, in pixels. The default value is 0.
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is <i>Nothing</i> . (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <i>useHandCursor</i> is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>value</i>	the amount of progress that has been made between the minimum and maximum values.
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Name	Description
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)

Name	Description
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexRadioButton Class

Description

The RadioButton control lets the user make a single choice within a set of mutually exclusive choices.

Inheritance Hierarchy

- [FlexButton](#)
 - FlexRadioButton

Syntax

```
'Declaration
Public Class FlexRadioButton _
Inherits FlexButton
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
color	the color of text in the component, including the component label. The default value is 0x0B333C. (Inherited from FlexButton)
currentState	the current view state of the component. (Inherited from FlexObject)
disabledColor	the color of text in the component if it is disabled. The default value is 0xAAB3B3. (Inherited from FlexButton)
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from FlexObject)

Name	Description
<i>fillAlphas</i>	the alphas used for the background fill of controls. (Inherited from <i>FlexButton</i>)
<i>fillColors</i>	the colors used to tint the background of the control. (Inherited from <i>FlexButton</i>)
<i>focusAlpha</i>	the alpha transparency value of the focus skin. The default value is 0.4. (Inherited from <i>FlexButton</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use. (Inherited from <i>FlexButton</i>)
<i>fontSize</i>	the height of the text, in pixels. (Inherited from <i>FlexButton</i>)
<i>fontStyle</i>	whether the text is italic font. (Inherited from <i>FlexButton</i>)
<i>fontWeight</i>	whether the text is boldface. (Inherited from <i>FlexButton</i>)
<i>groupName</i>	the name of the group to which this RadioButton control belongs, or specifies the value of the id property of a RadioButtonGroup control if this RadioButton is part of a group defined by a RadioButtonGroup control.
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>label</i>	the text to appear on the Button control. (Inherited from <i>FlexButton</i>)
<i>labelPlacement</i>	the orientation of the label in relation to a specified icon. (Inherited from <i>FlexButton</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)

Name	Description
<i>selected</i>	whether a toggle button is toggled on (true) or off (false). (Inherited from <i>FlexButton</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>textAlign</i>	the alignment of text within a container. (Inherited from <i>FlexButton</i>)
<i>textDecoration</i>	whether the text is underlined. (Inherited from <i>FlexButton</i>)
<i>textIndent</i>	the offset of the first line of text from the left side of the container, in pixels. The default value is 0. (Inherited from <i>FlexButton</i>)
<i>textRollOverColor</i>	the text color of the label as the user moves the mouse pointer over the button. The default value is 0x2B333C. (Inherited from <i>FlexButton</i>)
<i>textSelectedColor</i>	the text color of the label as the user presses it. The default value is 0x000000. (Inherited from <i>FlexButton</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toggle</i>	whether a Button is in a toggle state or not. (Inherited from <i>FlexButton</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject . (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)

Name	Description
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)

Name	Description
Type	Dispatched when the user presses a key. (Inherited from FlexButton)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexRepeater Class

Description

Identifies the repeater control, which creates multiple instances of its subcomponents.

Inheritance Hierarchy

- [TestObject](#)
 - FlexRepeater

Syntax

```
'Declaration
Public Class FlexRepeater _
Inherits TestObject _
Implements IClickable, IKeyable
```

Properties

Name	Description
automationClassName	a string containing the automation class name for the element.
automationIndex	a string containing the automation index for the element.
automationName	the name that can be used as an identifier for this object.
className	a string containing the class name of the element as assigned by the control developer.
columnNames	a list containing the names of all columns in the data.
count	the number of times this Repeater should execute.
firstVisibleRow	the index of the first visible child.
id	a string containing the automation identifier (ID) for the element.
lastVisibleRow	the index of the last visible child.
numColumns	the total number of columns in the data available.
numRows	the total number of rows of data available.
recycleChildren	whether this Repeater should re-use previously created children, or create new ones.
startingIndex	the index into the dataProvider at which this Repeater starts creating children.
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)

Name	Description
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetValues	Returns a matrix containing the automation values of all parts of the components.
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)

Name	Description
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)

If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a

Name	Description
	WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexRule Class

Description

Creates a single horizontal or vertical line. You typically use this control to create a dividing line within a container.

Inheritance Hierarchy

- [FlexObject](#)
 - FlexRule

Syntax

```
'Declaration
Public Class FlexRule _
Inherits FlexObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)

Name	Description
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>color</i>	the color of the line.
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>strokeWidth</i>	the thickness of the rule in pixels.
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)

Name	Description
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TestObject)
themeColor	the theme color of a component. (Inherited from FlexObject)
toolTip	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from FlexObject)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is <code>true</code> . If <code>useHandCursor</code> is <code>false</code> , the arrow pointer is used instead. (Inherited from FlexObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from FlexDisplayObject)
y	the y coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)

Name	Description
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)

Name	Description
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a

Name	Description
WaitForObject	WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexScrollBar Class

Description

Lets you control the portion of data that is displayed when there is too much data to fit in a display area.

Inheritance Hierarchy

- [FlexObject](#)
 - FlexScrollBar

Syntax

```
'Declaration
Public Class FlexScrollBar _
Inherits FlexObject

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)

Name	Description
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>fillColors</i>	the colors used to tint the background of the control.
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>lineScrollSize</i>	the amount to scroll when an arrow button is pressed, in pixels. The default value is 1.
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any <i>InteractiveObject</i> instance that is on the display list receives mouse events. If <i>mouseEnabled</i> is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the <i>mouseEnabled</i> behavior for all children of an object on the display list, use <code>flash.display.DisplayObjectContainer.mouseChildren</code> . (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>pageScrollSize</i>	the amount to move the scroll thumb when the scroll bar track is pressed, in pixels. The default value is 0.
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or <i>explicitWidth</i> properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)

Name	Description
<i>scrollPosition</i>	the number that represents the current scroll position.
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>trackColors</i>	The colors of the track, as an array of two colors.
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

FlexScrollBase Class

Description

The ScrollControlBase class is the base class for controls with scroll bars.

The user interacts with the scroll bar or the developer accesses methods and properties that alter the viewable area. The ScrollControlBase takes a single child object and positions and masks or sizes that object to display the viewable content. All items to be scrolled must be children of that content object.

Inheritance Hierarchy

Name	Description
<i>WaitForDisappearance</i>	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>) Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <i>OPT_WAIT_RESOLVE_OBJDEF</i> . Use <i>WaitForObject</i> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <i>WaitForObject</i> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <i>WaitForObject</i> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

FlexSlider Class

Description

Lets users select a value by moving a slider thumb between the end points of the slider track.

The current value of the slider is determined by the relative location of the thumb between the end points of the slider, corresponding to the slider's minimum and maximum values.

Inheritance Hierarchy

- [*FlexObject*](#)
 - FlexSlider

Syntax

```
'Declaration  
Public Class FlexSlider _  
Inherits FlexObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
currentState	the current view state of the component. (Inherited from FlexObject)
dataTipPrecision	the number of decimal places to use for the data tip text.
direction	the orientation of the slider control.
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from FlexObject)
fillColors	the colors used to tint the background of the control.
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from FlexObject)
height	the height of the display object, in pixels. (Inherited from FlexDisplayObject)
id	the ID of the component. (Inherited from FlexObject)
labels	an array of strings used for the slider labels.
labelStyleName	the name of the style to use for the slider label. The default value is undefined.
liveDragging	whether live dragging is enabled for the slider.
maximum	the maximum allowed value on the slider. The default value is 10.
minimum	the minimum allowed value on the slider control. The default value is 0.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that

Name	Description
	is on the display list receives mouse events. If <code>mouseEnabled</code> is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the <code>mouseEnabled</code> behavior for all children of an object on the display list, use <code>flash.display.DisplayObjectContainer.mouseChildren</code> . (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or <code>explicitWidth</code> properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>showDataTip</i>	whether the data tip shows during user interaction.
<i>snapInterval</i>	the increment value of the slider thumb as the user moves the thumb.
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>thumbCount</i>	the number of thumbs allowed on the slider.
<i>tickColor</i>	the color of the tick marks.
<i>tickLength</i>	the length in pixels of the tick marks.
<i>tickThickness</i>	the thickness in pixels of the tick marks.
<i>toolTip</i>	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from <i>FlexObject</i>)
<i>trackColors</i>	the colors of the track, as an array of two colors.
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <code>useHandCursor</code> is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>value</i>	the position of the thumb, and is a number between the minimum and maximum properties.

Name	Description
<i>values</i>	an array of values for each thumb when thumbCount is greater than 1.
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>Change</i>	Dispatched when the slider changes value due to mouse or keyboard interaction.
<i>ChangeFocus</i>	Changes the current focus. (Inherited from <i>FlexObject</i>)
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i>)
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i>)
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)

Name	Description
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexStandalonePlayer Class

Description

The Flex Standalone Player.

Inheritance Hierarchy

- [Window](#)
 - FlexStandalonePlayer

Syntax

```
'Declaration
Public Class FlexStandalonePlayer _
Inherits Window
```

Properties

Name	Description
Application	The name of the Application that this Window belongs to. (Inherited from Window)
Background	The background color of the GUI object. (Inherited from GuiTestObject)
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Name	Description
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)
WindowState	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from IMoveable)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
Close	Closes the window. (Inherited from IMoveable)
CloseSynchron	Closes the window and waits until the window is closed. (Inherited from IMoveable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetCloseWindows	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from IMoveable)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetFocus	Returns the object with the input focus. (Inherited from IMoveable)

Name	Description
<i>GetHorizontalBar</i>	Returns the horizontal scroll bar for this control. (Inherited from <i>IScrollable</i>)
<i>GetNextCloseWindow</i>	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from <i>IMoveable</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>GetVerticalBar</i>	Returns the vertical scroll bar for this control. (Inherited from <i>IScrollable</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsActive</i>	Returns whether the window is set to active. (Inherited from <i>IMoveable</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>Maximize</i>	Maximizes the window. (Inherited from <i>IMoveable</i>)
<i>Minimize</i>	Reduces the window to an icon. (Inherited from <i>IMoveable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>Move</i>	Moves the window. (Inherited from <i>IMoveable</i>)

Name	Description
OpenContextMenu	Opens a context menu at the specified position. (Inherited from BaseGuiTestObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Restore	Restores the window to its previous size. (Inherited from IMoveable)
SetActive	Makes the window active. (Inherited from IMoveable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
Size	Resizes the window. (Inherited from IMoveable)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object,

Name	Description
	for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexTabNavigator Class

Description

Extends the `ViewStack` container by including a `TabBar` container for navigating between its child containers.

Inheritance Hierarchy

- [FlexViewStack](#)
 - FlexTabNavigator

Syntax

```
'Declaration
Public Class FlexTabNavigator _
Inherits FlexViewStack
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)

Name	Description
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>backgroundAlpha</i>	the alpha level of the color defined by the <i>backgroundColor</i> property, of the image or SWF file defined by the <i>backgroundImage</i> style. Valid values range from 0.0 to 1.0. (Inherited from <i>FlexContainer</i>)
<i>backgroundColor</i>	the background color of a component. (Inherited from <i>FlexContainer</i>)
<i>backgroundDisabledColor</i>	the background color of the component when it is disabled. The global default value is undefined. (Inherited from <i>FlexContainer</i>)
<i>backgroundImage</i>	the background image of a component. This can be an absolute or relative URL or class. (Inherited from <i>FlexContainer</i>)
<i>backgroundSize</i>	the percentage to change the image size to for the specified <i>backgroundImage</i> . (Inherited from <i>FlexContainer</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>FlexContainer</i>)
<i>creationIndex</i>	the order to instantiate and draw the children of the container. (Inherited from <i>FlexContainer</i>)
<i>creationPolicy</i>	the child creation policy for this Container. (Inherited from <i>FlexContainer</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>fillAlphas</i>	the alpha transparency values used for the background fill of components. (Inherited from <i>FlexContainer</i>)
<i>fillColors</i>	the colors used to tint the background fill of the component. (Inherited from <i>FlexContainer</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexContainer</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use. (Inherited from <i>FlexContainer</i>)
<i>fontSize</i>	the height of the text, in pixels. (Inherited from <i>FlexContainer</i>)
<i>fontStyle</i>	whether the text is italic font. (Inherited from <i>FlexContainer</i>)

Name	Description
<i>fontWeight</i>	whether the text is boldface. (Inherited from <i>FlexContainer</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>horizontalAlign</i>	the horizontal positioning of tabs at the top of this TabNavigator container.
<i>horizontalGap</i>	the separation between tabs, in pixels. The default value is -1, so that the borders of adjacent tabs overlap.
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>label</i>	the text displayed by some navigator containers to represent this Container. (Inherited from <i>FlexContainer</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexContainer</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numChildren</i>	the number of child components in this container. (Inherited from <i>FlexContainer</i>)
<i>numColumns</i>	the total number of columns of data available. (Inherited from <i>FlexContainer</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>FlexContainer</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectedChild</i>	a reference to the currently visible child container. (Inherited from <i>FlexViewStack</i>)
<i>selectedIndex</i>	the zero-based index of the currently visible child container. (Inherited from <i>FlexViewStack</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)

Name	Description
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabHeight	the height of each tab, in pixels.
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
tabWidth	the width of each tab, in pixels.
Text	The text of the control. (Inherited from TestObject)
themeColor	the theme color of a component. (Inherited from FlexObject)
toolTip	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from FlexObject)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is <code>true</code> . If <code>useHandCursor</code> is <code>false</code> , the arrow pointer is used instead. (Inherited from FlexObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from FlexDisplayObject)
y	the y coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Change	Defines the value of the type property of the event object for an <code>ItemClick</code> event.
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)

Name	Description
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from FlexContainer)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from FlexContainer)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from FlexContainer)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. The return value is an array of rows, each of which is an array of items. (Inherited from FlexContainer)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)

Name	Description
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>MouseScroll</i>	Dispatched when a mouse wheel is spun over an <i>InteractiveObject</i> instance. (Inherited from <i>FlexContainer</i>)
<i>Move</i>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <i>FlexObject</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>Scroll</i>	Dispatched when the user manually scrolls the container. (Inherited from <i>FlexContainer</i>)
<i>SetFocus</i>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <i>FlexObject</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>ToString</i>	Returns a string representation of the control. (Inherited from <i>FlexDisplayObject</i>)

Name	Description
Type	Dispatched when the user presses a key. (Inherited from FlexViewStack)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexTextArea Class

Description

A multiline text field with a border and optional scroll bars.

The TextArea control supports the HTML rendering capabilities of Flash Player and AIR.

Inheritance Hierarchy

- [FlexScrollBase](#)
 - FlexTextArea

Syntax

```
'Declaration  
Public Class FlexTextArea _  
Inherits FlexScrollBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
color	the color of text in the component, including the component label. The default value is 0x0B333C.
currentState	the current view state of the component. (Inherited from FlexObject)
disabledColor	the background color of a component.
displayAsPassword	whether this control is used for entering passwords.
editable	whether the user can edit the text in this control.
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from FlexObject)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from FlexObject)
fontFamily	the name of the font to use.
fontSize	the height of the text, in pixels.
fontStyle	whether the text is italic font.
fontWeight	whether the text is boldface.

Name	Description
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>horizontalScrollPolicy</i>	whether the horizontal scroll bar is always on (ScrollPolicy.ON), always off (ScrollPolicy.OFF), or turns on when needed (ScrollPolicy.AUTO).
<i>htmlText</i>	the text displayed by the TextInput control, including HTML markup that expresses the styles of that text.
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>length</i>	the number of characters of text displayed in the TextArea.
<i>maxChars</i>	the maximum number of characters that users can enter in the text field.
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>restrict</i>	the set of characters that a user can enter into the control.
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectionBeginIndex</i>	the zero-based character index value of the first character in the current selection.
<i>selectionEndIndex</i>	the zero-based index of the position after the last character in the current selection (equivalent to the one-based index of the last character).
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TextObject</i>)

Name	Description
<code>text</code>	the plain text that appears in the control.
<code>themeColor</code>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<code>toolTip</code>	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from <i>FlexObject</i>)
<code>useHandCursor</code>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is <code>true</code> . If <code>useHandCursor</code> is <code>false</code> , the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<code>Value</code>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<code>visible</code>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<code>width</code>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<code>wordWrap</code>	whether text in the row should be word wrapped.
<code>x</code>	the x coordinate of the <i>DisplayObject</i> instance relative to the local coordinates of the parent <i>DisplayObjectContainer</i> . (Inherited from <i>FlexDisplayObject</i>)
<code>y</code>	the y coordinate of the <i>DisplayObject</i> instance relative to the local coordinates of the parent <i>DisplayObjectContainer</i> . (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<code>CaptureBitmap</code>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <i>TestObject</i>)
<code>ChangeFocus</code>	Changes the current focus. (Inherited from <i>FlexObject</i>)
<code>Click</code>	Clicks on the object. (Inherited from <i>IClickable</i>)
<code>DoubleClick</code>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i>)
<code>Exists</code>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <i>TestObject</i>)
<code>Exists</code>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)

Name	Description
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Input	Dispatched when the user types, deletes, or pastes text into the control.
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)

Name	Description
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from FlexScrollBase)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Scroll	Defines the value of the type property of the event object for a scroll event.
SelectText	Lets you track selection within a text field.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
WaitForObject	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject) Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexTitleWindow Class

Description

Contains a title bar, a caption, a border, and a content area for its child.

Typically, you use `TitleWindow` containers to wrap self-contained application modules. For example, you can include a form in a `TitleWindow` container. When the user completes the form, you can close the `TitleWindow` container programmatically, or let the user close it by using the Close button.

Inheritance Hierarchy

- [FlexPanel](#)
 - `FlexTitleWindow`

Syntax

```
'Declaration
Public Class FlexTitleWindow _
Inherits FlexPanel
```

Properties

Name	Description
<i>alpha</i>	the alpha transparency value of the object specified. (Inherited from <i>FlexDisplayObject</i>)
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i>)
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>backgroundAlpha</i>	the alpha level of the color defined by the <i>backgroundColor</i> property, of the image or SWF file defined by the <i>backgroundImage</i> style. Valid values range from 0.0 to 1.0. (Inherited from <i>FlexContainer</i>)
<i>backgroundColor</i>	the background color of a component. (Inherited from <i>FlexContainer</i>)
<i>backgroundDisabledColor</i>	the background color of the component when it is disabled. The global default value is undefined. (Inherited from <i>FlexContainer</i>)
<i>backgroundImage</i>	the background image of a component. This can be an absolute or relative URL or class. (Inherited from <i>FlexContainer</i>)
<i>backgroundSize</i>	the percentage to change the image size to for the specified <i>backgroundImage</i> . (Inherited from <i>FlexContainer</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>FlexContainer</i>)
<i>creationIndex</i>	the order to instantiate and draw the children of the container. (Inherited from <i>FlexContainer</i>)
<i>creationPolicy</i>	the child creation policy for this Container. (Inherited from <i>FlexContainer</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>dropShadowEnabled</i>	whether the Panel container's drop shadow is visible. The default value is true. (Inherited from <i>FlexPanel</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>fillAlphas</i>	the alpha transparency values used for the background fill of components. (Inherited from <i>FlexContainer</i>)

Name	Description
<i>fillColors</i>	the colors used to tint the background fill of the component. (Inherited from <i>FlexContainer</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexContainer</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use. (Inherited from <i>FlexContainer</i>)
<i>fontSize</i>	the height of the text, in pixels. (Inherited from <i>FlexContainer</i>)
<i>fontStyle</i>	whether the text is italic font. (Inherited from <i>FlexContainer</i>)
<i>fontWeight</i>	whether the text is boldface. (Inherited from <i>FlexContainer</i>)
<i>footerColors</i>	the array of two colors used to draw the footer (area for the ControlBar container) background. (Inherited from <i>FlexPanel</i>)
<i>headerColors</i>	the array of two colors used to draw the header. (Inherited from <i>FlexPanel</i>)
<i>headerHeight</i>	the height of the header. The default value is based on the style of the title text. (Inherited from <i>FlexPanel</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>label</i>	the text displayed by some navigator containers to represent this Container. (Inherited from <i>FlexContainer</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexContainer</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numChildren</i>	the number of child components in this container. (Inherited from <i>FlexContainer</i>)
<i>numColumns</i>	the total number of columns of data available. (Inherited from <i>FlexContainer</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>FlexContainer</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is

Name	Description
	NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>showCloseButton</i>	whether to display a Close button in the TitleWindow container. The default value is false.\
<i>status</i>	the text in the status area of the title bar. The default value is "". (Inherited from <i>FlexPanel</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>title</i>	the title or caption displayed in the title bar. The default value is "". (Inherited from <i>FlexPanel</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is <i>Nothing</i> . (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location

Name	Description
	<p>on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)</p>
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from FlexContainer)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from FlexContainer)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from FlexContainer)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)

Name	Description
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. The return value is an array of rows, each of which is an array of items. (Inherited from FlexContainer)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from FlexContainer)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Scroll	Dispatched when the user manually scrolls the container. (Inherited from FlexContainer)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)

Name	Description
 SetProperty 	Sets the value of the specified property. (Inherited from TestObject)
 TextCapture 	Returns the text in this object's visible area. (Inherited from TestObject)
 TextClick 	Clicks in the center of the specified text. (Inherited from TestObject)
 TextExists 	Returns whether the specified text exists. (Inherited from TestObject)
 TextRectangle 	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
 ToString 	Returns a string representation of the control. (Inherited from FlexDisplayObject)
 TypeKeys 	Sends a set of keystrokes to the object. (Inherited from IKeyable)
 TypePasswordKeys 	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
 WaitForChildDisappearance 	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForDisappearance 	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForObject 	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
 WaitForProperty 	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForPropertyNotEquals 	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexToggleButtonBar Class

Description

Defines a horizontal or vertical group of buttons that maintain their selected or deselected state.

Only one button in the ToggleButtonBar control can be in the selected state. This means that when a user selects a button in a ToggleButtonBar control, the button stays in the selected state until the user selects a different button.

Inheritance Hierarchy

- [FlexButtonBar](#)
 - FlexToggleButtonBar

Syntax

```
'Declaration
Public Class FlexToggleButtonBar _
Inherits FlexButtonBar
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
backgroundAlpha	the alpha level of the color defined by the backgroundColor property, of the image or SWF file defined by the backgroundImage style. Valid values range from 0.0 to 1.0. (Inherited from FlexContainer)
backgroundColor	the background color of a component. (Inherited from FlexContainer)
backgroundDisabledColor	the background color of the component when it is disabled. The global default value is undefined. (Inherited from FlexContainer)
backgroundImage	the background image of a component. This can be an absolute or relative URL or class. (Inherited from FlexContainer)

Name	Description
<i>backgroundSize</i>	the percentage to change the image size to for the specified <i>backgroundImage</i> . (Inherited from <i>FlexContainer</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>FlexContainer</i>)
<i>creationIndex</i>	the order to instantiate and draw the children of the container. (Inherited from <i>FlexContainer</i>)
<i>creationPolicy</i>	the child creation policy for this Container. (Inherited from <i>FlexContainer</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>direction</i>	whether to use vertical (default) or horizontal layout. (Inherited from <i>FlexBox</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>fillAlphas</i>	the alpha transparency values used for the background fill of components. (Inherited from <i>FlexContainer</i>)
<i>fillColors</i>	the colors used to tint the background fill of the component. (Inherited from <i>FlexContainer</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexContainer</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use. (Inherited from <i>FlexContainer</i>)
<i>fontSize</i>	the height of the text, in pixels. (Inherited from <i>FlexContainer</i>)
<i>fontStyle</i>	whether the text is italic font. (Inherited from <i>FlexContainer</i>)
<i>fontWeight</i>	whether the text is boldface. (Inherited from <i>FlexContainer</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>horizontalAlign</i>	the horizontal alignment of children in the container. (Inherited from <i>FlexBox</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>label</i>	the text displayed by some navigator containers to represent this Container. (Inherited from <i>FlexContainer</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexContainer</i>)

Name	Description
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numChildren</i>	the number of child components in this container. (Inherited from <i>FlexContainer</i>)
<i>numColumns</i>	the total number of columns of data available. (Inherited from <i>FlexContainer</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>FlexContainer</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectedIndex</i>	the index of the active navigation item, where the first item is at an index of 0. The default value is -1. (Inherited from <i>FlexNavigationBar</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)

Name	Description
verticalAlign	the vertical alignment of children in the container. (Inherited from FlexBox)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Change	Defines the value of the type property of the event object for an itemClick event. (Inherited from FlexNavigationBar)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from FlexContainer)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from FlexContainer)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from FlexContainer)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)

Name	Description
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. The return value is an array of rows, each of which is an array of items. (Inherited from FlexContainer)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)

Name	Description
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from FlexContainer)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Scroll	Dispatched when the user manually scrolls the container. (Inherited from FlexContainer)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key. (Inherited from FlexNavigationBar)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

FlexTree Class

Description

The Tree control lets a user view hierarchical data arranged as an expandable tree.

Each item in a tree can be a leaf or a branch. A leaf item is an end point in the tree. A branch item can contain leaf or branch items, or it can be empty.

By default, a leaf is represented by a text label next to a file icon. A branch is represented by a text label next to a folder icon, with a disclosure triangle that a user can open to expose children.

Inheritance Hierarchy

- [*FlexList*](#)
 - FlexTree

Syntax

```
'Declaration  
Public Class FlexTree _  
Inherits FlexList
```

Properties

Name	Description
allowMultipleSelection	whether you can allow more than one item to be selected at the same time. (Inherited from FlexListBase)
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
alternatingItemColors	the colors to use for the backgrounds of the items in the list. (Inherited from FlexListBase)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
backgroundDisabledColor	the color of text in the component if it is disabled. The default value is 0xAAB3B3. (Inherited from FlexListBase)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
columnCount	the number of columns to be displayed in a <i>TileList</i> control or items in a <i>HorizontalList</i> control. (Inherited from FlexListBase)
columnNames	a list containing the names of all columns in the data. (Inherited from FlexListBase)
columnWidth	the width of the control's columns. (Inherited from FlexListBase)
currentState	the current view state of the component. (Inherited from FlexObject)
dataTipField	the name of the field in the data provider items to display as the data tip. (Inherited from FlexListBase)
depthColors	the array of colors used in the <i>Tree</i> control, in descending order. The default value is undefined.
disabledColor	the disabled color of a list item. The default value is 0xDDDDDD.
editable	whether the user can edit items in the data provider.
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from FlexObject)

Name	Description
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexListBase</i>)
<i>focusAlpha</i>	the alpha transparency value of the focus skin. The default value is 0.4. (Inherited from <i>FlexListBase</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>iconField</i>	the name of the field in the data provider object that determines what to display as the icon. (Inherited from <i>FlexListBase</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>indentation</i>	the indentation for each tree level, in pixels. The default value is 17.
<i>labelField</i>	the name of the field in the data provider items to display as the label. (Inherited from <i>FlexListBase</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexListBase</i>)
<i>lockedColumnCount</i>	the index of the first column in the control that scrolls. (Inherited from <i>FlexListBase</i>)
<i>lockedRowCount</i>	the index of the first row in the control that scrolls. (Inherited from <i>FlexListBase</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>FlexListBase</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>FlexListBase</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>rollOverColor</i>	the color of the background of a renderer when the user rolls over it. The default value is 0xEEFEE6. (Inherited from <i>FlexListBase</i>)
<i>rowCount</i>	the number of rows to be displayed. (Inherited from <i>FlexListBase</i>)
<i>rowHeight</i>	the height of the rows in pixels. (Inherited from <i>FlexListBase</i>)

Name	Description
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectable</i>	whether the list shows selected items as selected. (Inherited from <i>FlexListBase</i>)
<i>selectedIndex</i>	the index in the data provider of the selected item. (Inherited from <i>FlexListBase</i>)
<i>selectedIndices</i>	an array of indices in the data provider of the selected items. (Inherited from <i>FlexListBase</i>)
<i>selectedItem</i>	a reference to the selected item in the data provider. (Inherited from <i>FlexListBase</i>)
<i>selectedItems</i>	an array of references to the selected items in the data provider. (Inherited from <i>FlexListBase</i>)
<i>selectionColor</i>	the color of the background of a renderer when the user selects it. The default value is 0x7FCEFF. (Inherited from <i>FlexListBase</i>)
<i>selectionDisabledColor</i>	the color of the background of a renderer when the component is disabled. The default value is 0xDDDDDD. (Inherited from <i>FlexListBase</i>)
<i>showDataTips</i>	whether dataTips are displayed for text in the rows. (Inherited from <i>FlexListBase</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TextObject</i>)
<i>textRollOverColor</i>	the text color of the label as the user moves the mouse pointer over the button. The default value is 0x2B333C. (Inherited from <i>FlexListBase</i>)
<i>textSelectedColor</i>	the color of the text of a renderer when the user selects it. The default value is 0x2B333C. (Inherited from <i>FlexListBase</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>useRollOver</i>	whether items are highlighted as the mouse rolls over them. (Inherited from <i>FlexListBase</i>)

Name	Description
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
variableRowHeight	whether the individual rows can have different height. (Inherited from FlexListBase)
verticalAlign	the vertical alignment of a renderer in a row. (Inherited from FlexListBase)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
wordWrap	whether text in the row should be word wrapped. (Inherited from FlexListBase)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant System.Drawing.Imaging.PixelFormat.Format32bppRgb can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
Close	Closes or collapses a tree branch.
Deselect	Defines the value of the type property of the event object for an event that is dispatched when a previously selected item is deselected. (Inherited from FlexListBase)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DoubleClick	Defines the value of the type property of the ListEvent object for an itemDoubleClick event, which indicates that the user double-clicked the mouse over a visual item in the control. (Inherited from FlexListBase)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from FlexListBase)

Name	Description
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from FlexListBase)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from FlexListBase)
Edit	Defines the value of the type property of the event object for a itemEditBegin event, which indicates that an item is ready to be edited. (Inherited from FlexList)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from FlexListBase)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)

Name	Description
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from FlexScrollBase)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
MultiSelect	Defines the value of the type property of the event object for an event that is dispatched when an item is selected as part of an action that selects multiple items. (Inherited from FlexListBase)
Open	Opens or expands a tree branch.
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Scroll	Defines the value of the type property of the event object for a scroll event. (Inherited from FlexListBase)
ScrollToIndex	Ensures that the data provider item at the given index is visible. (Inherited from FlexListBase)
Select	Defines the value of the type property of the event object for an event that is dispatched when a single item is selected. (Inherited from FlexListBase)
SelectIndex	Defines the value of the type property of the event object for an event that is dispatched when a single item is selected. (Inherited from FlexListBase)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)

Name	Description
 SetProperty 	Sets the value of the specified property. (Inherited from TestObject)
 TextCapture 	Returns the text in this object's visible area. (Inherited from TestObject)
 TextClick 	Clicks in the center of the specified text. (Inherited from TestObject)
 TextExists 	Returns whether the specified text exists. (Inherited from TestObject)
 TextRectangle 	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
 ToString 	Returns a string representation of the control. (Inherited from FlexDisplayObject)
 Type 	Dispatched when the user presses a key. (Inherited from FlexListBase)
 TypeKeys 	Sends a set of keystrokes to the object. (Inherited from IKeyable)
 TypePasswordKeys 	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
 WaitForChildDisappearance 	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForDisappearance 	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForObject 	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
 WaitForProperty 	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForPropertyNotEquals 	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout

Name	Description
	specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexUIMovieClip Class

Description

Components created in Adobe Flash CS3 Professional for use in Flex are subclasses of the mx.flash.UIMovieClip class.

The UIMovieClip class implements the interfaces necessary for a Flash component to be used like a normal Flex component. Therefore, a subclass of UIMovieClip can be used as a child of a Flex container or as a skin, and it can respond to events, define view states and transitions, and work with effects in the same way as can any Flex component.

Inheritance Hierarchy

- [FlexDisplayObject](#)
 - FlexUIMovieClip
 - [FlexContainerMovieClip](#)

Syntax

```
'Declaration
Public Class FlexUIMovieClip _
Inherits FlexDisplayObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element.
automationIndex	a string containing the automation index for the element.
automationName	the name that can be used as an identifier for this object.
className	the name of this instance's class, such as "Button".
currentState	the current state of this component.
enabled	whether a movie clip is enabled.
errorColor	the color of the component highlight when validation fails.

Name	Description
<i>errorString</i>	the text that is displayed by a component's error tip when a component is monitored and validation fails.
<i>focusEnabled</i>	whether the component can receive focus when selected.
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component.
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has.
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. Valid values are 0 to 100.
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Valid values are 0 to 100.
<i>scaleX</i>	the horizontal scale (percentage) of the object as applied from the registration point. The default registration point is (0,0). 1.0 equals 100% scale.
<i>scaleY</i>	the vertical scale (percentage) of an object as applied from the registration point of the object. The default registration point is (0,0). 1.0 is 100% scale.
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component.
<i>toolTip</i>	the text to display in the ToolTip. The default value is <code>Nothing</code> .
<i>useHandCursor</i>	whether the pointing hand (hand cursor) appears when the mouse rolls over a sprite in which the <code>buttonMode</code> property is set to true.
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)

Name	Description
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>ChangeFocus</i>	Defines the value of the type property of a keyFocusChange event object.
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i>)
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i>)
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <i>TestObject</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)

Name	Description
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>GetStyle</i>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <i>FlexDisplayObject</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>SetFocus</i>	Called by the FocusManager when the component receives focus. The component may in turn set focus to an internal component.
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)

Name	Description
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexVideoDisplay Class

Description

Lets you play an FLV file in a Flex application. It supports progressive download over HTTP, streaming from the Flash Media Server, and streaming from a Camera object.

Inheritance Hierarchy

- *FlexObject*
 - FlexVideoDisplay

Syntax

```
'Declaration  
Public Class FlexVideoDisplay _  
Inherits FlexObject
```

Properties

Name	Description
<i>alpha</i>	the alpha transparency value of the object specified. (Inherited from <i>FlexDisplayObject</i>)
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i>)
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to

Name	Description
	false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>source</i>	the relative path and filename of the FLV file to stream.
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>totalTime</i>	the total length of the media, in seconds.
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>volume</i>	the volume level, specified as an value between 0 and 1. The default value is 0.75.
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Name	Description
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)

Name	Description
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

FlexViewStack Class

Description

Consists of a collection of child containers stacked on top of each other, where only one child at a time is visible. When a different child container is selected, it seems to replace the old one because it appears in the same location. However, the old child container still exists; it is just invisible.

Inheritance Hierarchy

- *FlexContainer*
 - FlexViewStack
 - *FlexTabNavigator*

Syntax

```
'Declaration
Public Class FlexViewStack _
Inherits FlexContainer
```

Properties

Name	Description
<i>alpha</i>	the alpha transparency value of the object specified. (Inherited from <i>FlexDisplayObject</i>)
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i>)
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>backgroundAlpha</i>	the alpha level of the color defined by the backgroundColor property, of the image or SWF file defined by the backgroundImage style. Valid values range from 0.0 to 1.0. (Inherited from <i>FlexContainer</i>)
<i>backgroundColor</i>	the background color of a component. (Inherited from <i>FlexContainer</i>)
<i>backgroundDisabledColor</i>	the background color of the component when it is disabled. The global default value is undefined. (Inherited from <i>FlexContainer</i>)
<i>backgroundImage</i>	the background image of a component. This can be an absolute or relative URL or class. (Inherited from <i>FlexContainer</i>)
<i>backgroundSize</i>	the percentage to change the image size to for the specified backgroundImage. (Inherited from <i>FlexContainer</i>)

Name	Description
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>FlexContainer</i>)
<i>creationIndex</i>	the order to instantiate and draw the children of the container. (Inherited from <i>FlexContainer</i>)
<i>creationPolicy</i>	the child creation policy for this Container. (Inherited from <i>FlexContainer</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>fillAlphas</i>	the alpha transparency values used for the background fill of components. (Inherited from <i>FlexContainer</i>)
<i>fillColors</i>	the colors used to tint the background fill of the component. (Inherited from <i>FlexContainer</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexContainer</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use. (Inherited from <i>FlexContainer</i>)
<i>fontSize</i>	the height of the text, in pixels. (Inherited from <i>FlexContainer</i>)
<i>fontStyle</i>	whether the text is italic font. (Inherited from <i>FlexContainer</i>)
<i>fontWeight</i>	whether the text is boldface. (Inherited from <i>FlexContainer</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>label</i>	the text displayed by some navigator containers to represent this Container. (Inherited from <i>FlexContainer</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexContainer</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use <code>flash.display.DisplayObjectContainer.mouseChildren</code> . (Inherited from <i>FlexDisplayObject</i>)

Name	Description
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numChildren</i>	the number of child components in this container. (Inherited from <i>FlexContainer</i>)
<i>numColumns</i>	the total number of columns of data available. (Inherited from <i>FlexContainer</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>FlexContainer</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectedChild</i>	a reference to the currently visible child container.
<i>selectedIndex</i>	the zero-based index of the currently visible child container.
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Name	Description
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from FlexContainer)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from FlexContainer)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from FlexContainer)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)

Name	Description
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. The return value is an array of rows, each of which is an array of items. (Inherited from FlexContainer)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from FlexContainer)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)

Name	Description
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Scroll	Dispatched when the user manually scrolls the container. (Inherited from FlexContainer)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the

Name	Description
WaitForPropertyNotEquals	optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject) Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexWindow Class

Description

The Window is a top-level container for additional windows in an AIR desktop application.

Inheritance Hierarchy

- [FlexContainer](#)
 - FlexWindow

Syntax

```
'Declaration
Public Class FlexWindow _
Inherits FlexContainer _
Implements IMoveable
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
alwaysInFront	a value whether the underlying NativeWindow is always in front of other windows.
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)

Name	Description
<i>backgroundAlpha</i>	the alpha level of the color defined by the <code>backgroundColor</code> property, of the image or SWF file defined by the <code>backgroundImage</code> style. Valid values range from 0.0 to 1.0. (Inherited from <i>FlexContainer</i>)
<i>backgroundColor</i>	the background color of a component. (Inherited from <i>FlexContainer</i>)
<i>backgroundDisabledColor</i>	the background color of the component when it is disabled. The global default value is undefined. (Inherited from <i>FlexContainer</i>)
<i>backgroundImage</i>	the background image of a component. This can be an absolute or relative URL or class. (Inherited from <i>FlexContainer</i>)
<i>backgroundSize</i>	the percentage to change the image size to for the specified <code>backgroundImage</code> . (Inherited from <i>FlexContainer</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>closed</i>	a value whether the underlying window has been closed.
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>FlexContainer</i>)
<i>creationIndex</i>	the order to instantiate and draw the children of the container. (Inherited from <i>FlexContainer</i>)
<i>creationPolicy</i>	the child creation policy for this Container. (Inherited from <i>FlexContainer</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>fillAlphas</i>	the alpha transparency values used for the background fill of components. (Inherited from <i>FlexContainer</i>)
<i>fillColors</i>	the colors used to tint the background fill of the component. (Inherited from <i>FlexContainer</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexContainer</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use. (Inherited from <i>FlexContainer</i>)
<i>fontSize</i>	the height of the text, in pixels. (Inherited from <i>FlexContainer</i>)
<i>fontStyle</i>	whether the text is italic font. (Inherited from <i>FlexContainer</i>)
<i>fontWeight</i>	whether the text is boldface. (Inherited from <i>FlexContainer</i>)

Name	Description
height	the height of the display object, in pixels. (Inherited from FlexDisplayObject)
id	the ID of the component. (Inherited from FlexObject)
isAIRWindow	a value whether this window is an AIR window.
label	the text displayed by some navigator containers to represent this Container. (Inherited from FlexContainer)
lastVisibleRow	the index of the last visible child. (Inherited from FlexContainer)
maxHeight	The maximum recommended height of the component to be considered by the parent during layout.
maximizable	a value whether the window can be maximized.
maxWidth	The maximum recommended width of the component to be considered by the parent during layout.
minHeight	The minimum recommended height of the component to be considered by the parent during layout.
minimizable	a value whether the window can be minimized.
minWidth	The minimum recommended width of the component to be considered by the parent during layout.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from FlexDisplayObject)
numAutomationChildren	the number of automation children this container has. (Inherited from FlexObject)
numChildren	the number of child components in this container. (Inherited from FlexContainer)
numColumns	the total number of columns of data available. (Inherited from FlexContainer)
numRows	the total number of rows of data available. (Inherited from FlexContainer)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from FlexObject)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from FlexObject)
resizable	a value whether the window can be resized.
scaleX	the number that specifies the horizontal scaling factor. (Inherited from FlexObject)

Name	Description
scaleY	the number that specifies the vertical scaling factor. (Inherited from FlexObject)
showStatusBar	a value whether the status bar is visible.
status	The string that appears in the status bar, if it is visible.
systemChrome	the type of system chrome (if any) the window has.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from FlexDisplayObject)
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TestObject)
themeColor	the theme color of a component. (Inherited from FlexObject)
title	The title that appears in the window title bar and the taskbar.
toolTip	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from FlexObject)
transparent	a value whether the window is transparent.
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <code>useHandCursor</code> is false, the arrow pointer is used instead. (Inherited from FlexObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
WindowState	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from IMoveable)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored

Name	Description
	in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
Close	Closes the window. (Inherited from IMoveable)
CloseSynchron	Closes the window and waits until the window is closed. (Inherited from IMoveable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Defines the value of the type property of the event object for a dragComplete event. (Inherited from FlexContainer)
DragDrop	Defines the value of the type property of the event object for a dragDrop event. (Inherited from FlexContainer)
DragStart	Defines the value of the type property of the event object for a dragStart event. (Inherited from FlexContainer)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetCloseWindows	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from IMoveable)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetFocus	Returns the object with the input focus. (Inherited from IMoveable)
GetNextCloseWindow	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from IMoveable)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)

Name	Description
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. The return value is an array of rows, each of which is an array of items. (Inherited from FlexContainer)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsActive	Returns whether the window is set to active. (Inherited from IMoveable)
Maximize	Maximizes the window. (Inherited from IMoveable)
Minimize	Reduces the window to an icon. (Inherited from IMoveable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from FlexContainer)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from IMoveable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Restore	Restores the window to its previous size. (Inherited from IMoveable)
Scroll	Dispatched when the user manually scrolls the container. (Inherited from FlexContainer)
SetActive	Makes the window active. (Inherited from IMoveable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
Size	Resizes the window. (Inherited from IMoveable)
StateChange	Dispatched when the displaystatus of the window is changed.
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by

Name	Description
	setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

FlexWindowedApplication Class

Description

The `WindowedApplication` defines the application container that you use to create Flex applications for AIR applications.

Inheritance Hierarchy

- [FlexApplication](#)
 - `FlexWindowedApplication`

Syntax

```
'Declaration
Public Class FlexWindowedApplication _
Inherits FlexApplication _
Implements IMoveable
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)

Name	Description
<i>alwaysInFront</i>	a value whether the underlying NativeWindow is always in front of other windows.
<i>applicationID</i>	The identifier that AIR uses to identify the application.
<i>autoExit</i>	a value whether the AIR application will quit when the last window closes or will continue running in the background.
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i>)
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>backgroundAlpha</i>	the alpha level of the color defined by the backgroundColor property, of the image or SWF file defined by the backgroundImage style. Valid values range from 0.0 to 1.0. (Inherited from <i>FlexContainer</i>)
<i>backgroundColor</i>	the background color of a component. (Inherited from <i>FlexContainer</i>)
<i>backgroundDisabledColor</i>	the background color of the component when it is disabled. The global default value is undefined. (Inherited from <i>FlexContainer</i>)
<i>backgroundImage</i>	the background image of a component. This can be an absolute or relative URL or class. (Inherited from <i>FlexContainer</i>)
<i>backgroundSize</i>	the percentage to change the image size to for the specified backgroundImage. (Inherited from <i>FlexContainer</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>closed</i>	a value whether the underlying window has been closed.
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>FlexContainer</i>)
<i>creationIndex</i>	the order to instantiate and draw the children of the container. (Inherited from <i>FlexContainer</i>)
<i>creationPolicy</i>	the child creation policy for this Container. (Inherited from <i>FlexContainer</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>fillAlphas</i>	the alpha transparency values used for the background fill of components. (Inherited from <i>FlexContainer</i>)

Name	Description
<i>fillColors</i>	the colors used to tint the background fill of the component. (Inherited from <i>FlexContainer</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>FlexContainer</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>fontFamily</i>	the name of the font to use. (Inherited from <i>FlexContainer</i>)
<i>fontSize</i>	the height of the text, in pixels. (Inherited from <i>FlexContainer</i>)
<i>fontStyle</i>	whether the text is italic font. (Inherited from <i>FlexContainer</i>)
<i>fontWeight</i>	whether the text is boldface. (Inherited from <i>FlexContainer</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>label</i>	the text displayed by some navigator containers to represent this Container. (Inherited from <i>FlexContainer</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>FlexContainer</i>)
<i>maxHeight</i>	The maximum recommended height of the component to be considered by the parent during layout.
<i>maximizable</i>	a value whether the window can be maximized.
<i>maxWidth</i>	The maximum recommended width of the component to be considered by the parent during layout.
<i>minHeight</i>	The minimum recommended height of the component to be considered by the parent during layout.
<i>minimizable</i>	a value whether the window can be minimized.
<i>minWidth</i>	The minimum recommended width of the component to be considered by the parent during layout.
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numChildren</i>	the number of child components in this container. (Inherited from <i>FlexContainer</i>)
<i>numColumns</i>	the total number of columns of data available. (Inherited from <i>FlexContainer</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>FlexContainer</i>)

Name	Description
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>resizable</i>	a value whether the window can be resized.
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>showStatusBar</i>	a value whether the status bar is visible.
<i>status</i>	The string that appears in the status bar, if it is visible.
<i>systemChrome</i>	the type of system chrome (if any) the window has.
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>title</i>	The title that appears in the window title bar and the taskbar.
<i>toolTip</i>	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from <i>FlexObject</i>)
<i>transparent</i>	a value whether the window is transparent.
<i>url</i>	the URL from which this Application's SWF file was loaded. (Inherited from <i>FlexApplication</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <code>useHandCursor</code> is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>WindowState</i>	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from <i>IMoveable</i>)

Name	Description
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>ChangeFocus</i>	Changes the current focus. (Inherited from <i>FlexObject</i>)
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i>)
<i>Close</i>	Closes the window. (Inherited from <i>IMoveable</i>)
<i>CloseSynchron</i>	Closes the window and waits until the window is closed. (Inherited from <i>IMoveable</i>)
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i>)
<i>DragCancel</i>	Defines the value of the type property of the event object for a dragComplete event. (Inherited from <i>FlexContainer</i>)
<i>DragDrop</i>	Defines the value of the type property of the event object for a dragDrop event. (Inherited from <i>FlexContainer</i>)
<i>DragStart</i>	Defines the value of the type property of the event object for a dragStart event. (Inherited from <i>FlexContainer</i>)
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)

Name	Description
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetCloseWindows	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from IMoveable)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetFocus	Returns the object with the input focus. (Inherited from IMoveable)
GetNextCloseWindow	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from IMoveable)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. The return value is an array of rows, each of which is an array of items. (Inherited from FlexContainer)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)

Name	Description
IsActive	Returns whether the window is set to active. (Inherited from IMoveable)
Maximize	Maximizes the window. (Inherited from IMoveable)
Minimize	Reduces the window to an icon. (Inherited from IMoveable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from FlexContainer)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from IMoveable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Restore	Restores the window to its previous size. (Inherited from IMoveable)
Scroll	Dispatched when the user manually scrolls the container. (Inherited from FlexContainer)
SetActive	Makes the window active. (Inherited from IMoveable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
Size	Resizes the window. (Inherited from IMoveable)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)

Name	Description
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

SparkAirHTML Class

Description

The HTML control lets you display HTML content in your application.

Inheritance Hierarchy

- [FlexScrollBase](#)
 - SparkAirHTML

Syntax

```
'Declaration
Public Class SparkAirHTML _
Inherits FlexScrollBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
currentState	the current view state of the component. (Inherited from FlexObject)
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from FlexObject)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from FlexObject)
height	the height of the display object, in pixels. (Inherited from FlexDisplayObject)
id	the ID of the component. (Inherited from FlexObject)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use <code>flash.display.DisplayObjectContainer.mouseChildren</code> . (Inherited from FlexDisplayObject)
numAutomationChildren	the number of automation children this container has. (Inherited from FlexObject)

Name	Description
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is <i>Nothing</i> . (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha

Name	Description
	channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this <code>TestObject</code> . (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)

Name	Description
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MouseScroll	Dispatched when a mouse wheel is spun over an InteractiveObject instance. (Inherited from FlexScrollBase)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Scroll	Dispatched when the scroll events occur. This event is dispatched if the scrolling is done programmatically or by the user.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)

Name	Description
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkApplication Class

Description

Flex defines a default, or Application, container that lets you start adding content to your application without explicitly defining another container.

Inheritance Hierarchy

- [SparkSkinnableContainer](#)
 - SparkApplication
 - [SparkWindowedApplication](#)

Syntax

```
'Declaration
Public Class SparkApplication _
Inherits SparkSkinnableContainer
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
autoLayout	whether measurement and layout are done when the position or size of a child is changed. (Inherited from SparkSkinnableContainer)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
colorCorrection	The value of the stage's colorCorrection property.
columnNames	a list containing the names of all columns in the data. (Inherited from SparkSkinnableContainerBase)
controlBarVisible	whether the control bar is visible.
creationPolicy	the content creation policy for this component. (Inherited from SparkSkinnableContainer)
currentState	the current view state of the component. (Inherited from FlexObject)
deferredContentCreated	whether deferred content has been created. (Inherited from SparkSkinnableContainer)
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from FlexObject)

Name	Description
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>numElements</i>	The number of visual elements in this container. (Inherited from <i>SparkSkinnableContainer</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)

Name	Description
toolTip	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from FlexObject)
url	The URL from which this Application's SWF file was loaded.
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is <code>true</code> . If <code>useHandCursor</code> is <code>false</code> , the arrow pointer is used instead. (Inherited from FlexObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
viewSourceURL	the URL where the application's source can be viewed.
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from FlexDisplayObject)
y	the y coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from SparkSkinnableContainerBase)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from SparkSkinnableContainerBase)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from SparkSkinnableContainerBase)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the

Name	Description
	agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from SparkSkinnableContainerBase)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)

Name	Description
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout

Name	Description
WaitForObject	parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject) Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkBorderContainer Class

Description

The `BorderContainer` class defines a set of CSS styles that control the appearance of the border and background fill of the container.

Inheritance Hierarchy

- [SparkSkinnableContainer](#)
 - `SparkBorderContainer`

Syntax

```
'Declaration
Public Class SparkBorderContainer _
Inherits SparkSkinnableContainer
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
autoLayout	whether measurement and layout are done when the position or size of a child is changed. (Inherited from SparkSkinnableContainer)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
columnNames	a list containing the names of all columns in the data. (Inherited from SparkSkinnableContainerBase)
creationPolicy	the content creation policy for this component. (Inherited from SparkSkinnableContainer)
currentState	the current view state of the component. (Inherited from FlexObject)
deferredContentCreated	whether deferred content has been created. (Inherited from SparkSkinnableContainer)
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from FlexObject)
firstVisibleRow	the index of the first visible child. (Inherited from SparkSkinnableContainerBase)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from FlexObject)
height	the height of the display object, in pixels. (Inherited from FlexDisplayObject)
id	the ID of the component. (Inherited from FlexObject)
lastVisibleRow	the index of the last visible child. (Inherited from SparkSkinnableContainerBase)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the

Name	Description
	mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>numElements</i>	The number of visual elements in this container. (Inherited from <i>SparkSkinnableContainer</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Name	Description
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from SparkSkinnableContainerBase)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from SparkSkinnableContainerBase)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from SparkSkinnableContainerBase)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)

Name	Description
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from SparkSkinnableContainerBase)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)

Name	Description
<i>SetFocus</i>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <i>FlexObject</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>ToString</i>	Returns a string representation of the control. (Inherited from <i>FlexDisplayObject</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout

Name	Description
	specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkButton Class

Description

The SparkButton component is a commonly used rectangular button. The SparkButton component looks like it can be pressed.

Inheritance Hierarchy

- [SparkButtonBase](#)
 - SparkButton
 - [SparkMuteButton](#)

Syntax

```
'Declaration
Public Class SparkButton _
Inherits SparkButtonBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
autoRepeat	whether to dispatch repeated buttonDown events if the user holds down the mouse button. (Inherited from SparkButtonBase)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
currentState	the current view state of the component. (Inherited from FlexObject)
emphasized	whether the default button as requested by the focus manager.

Name	Description
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from FlexObject)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from FlexObject)
height	the height of the display object, in pixels. (Inherited from FlexDisplayObject)
id	the ID of the component. (Inherited from FlexObject)
label	the text to appear on the ButtonBase control. (Inherited from SparkButtonBase)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from FlexDisplayObject)
numAutomationChildren	the number of automation children this container has. (Inherited from FlexObject)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from FlexObject)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from FlexObject)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from FlexObject)
scaleY	the number that specifies the vertical scaling factor. (Inherited from FlexObject)
stickyHighlighting	a value whether the button displays its down skin when the user presses it but changes to its over skin when the user drags the mouse off of it. (Inherited from SparkButtonBase)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from FlexDisplayObject)
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TestObject)

Name	Description
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is <i>Nothing</i> . (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is <i>true</i> . If <i>useHandCursor</i> is <i>false</i> , the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the <i>DisplayObject</i> instance relative to the local coordinates of the parent <i>DisplayObjectContainer</i> . (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the <i>DisplayObject</i> instance relative to the local coordinates of the parent <i>DisplayObjectContainer</i> . (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <i>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</i> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkButtonBar Class

Description

The `ButtonBar` control defines a horizontal group of logically related buttons with a common look and navigation.

Inheritance Hierarchy

- [SparkListBase](#)
 - `SparkButtonBar`

Syntax

```
'Declaration
Public Class SparkButtonBar _
Inherits SparkListBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
autoLayout	the measurement and layout are done when the position or size of a child is changed. (Inherited from SparkSkinnableDataContainer)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)

Name	Description
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>caretIndex</i>	The item that is currently in focus. (Inherited from <i>SparkListBase</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>labelField</i>	The name of the field in the data provider items to display as the label. (Inherited from <i>SparkListBase</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any <i>InteractiveObject</i> instance that is on the display list receives mouse events. If <i>mouseEnabled</i> is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the <i>mouseEnabled</i> behavior for all children of an object on the display list, use <code>flash.display.DisplayObjectContainer.mouseChildren</code> . (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>SparkSkinnableContainerBase</i>)

Name	Description
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>requireSelection</i>	a value if a data item must always be selected in the control (Inherited from <i>SparkListBase</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectedIndex</i>	The 0-based index of the selected item, or -1 if no item is selected. (Inherited from <i>SparkListBase</i>)
<i>selectedItem</i>	The item that is currently selected. (Inherited from <i>SparkListBase</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>useVirtualLayout</i>	the value of the useVirtualLayout property of the layout associated with this control. (Inherited from <i>SparkListBase</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from SparkSkinnableContainerBase)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from SparkSkinnableContainerBase)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from SparkSkinnableContainerBase)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject . (Inherited from TestObject)
GetItemsCount	Gets the number of items in the ComboBox. (Inherited from SparkListBase)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)

Name	Description
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from SparkSkinnableContainerBase)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Select	Dispatched when an item in the list is selected. (Inherited from SparkListBase)

Name	Description
SelectIndex	Dispatched when the user clicks on an item in the list or navigates to the item using a keyboard.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key. (Inherited from SparkListBase)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
WaitForPropertyNotEquals	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkButtonBarButton Class

Description

The ButtonBarButton class defines the custom item renderer used by the ButtonBar control.

Inheritance Hierarchy

- [SparkToggleButton](#)
 - SparkButtonBarButton

Syntax

```
'Declaration
Public Class SparkButtonBarButton _
Inherits SparkToggleButton
```

Properties

Name	Description
allowDeselection	a value whether the user click on a currently selected button deselects it.
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
autoRepeat	whether to dispatch repeated buttonDown events if the user holds down the mouse button. (Inherited from SparkButtonBase)

Name	Description
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>label</i>	the text to appear on the <i>ButtonBase</i> control. (Inherited from <i>SparkButtonBase</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any <i>InteractiveObject</i> instance that is on the display list receives mouse events. If <i>mouseEnabled</i> is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the <i>mouseEnabled</i> behavior for all children of an object on the display list, use <i>flash.display.DisplayObjectContainer.mouseChildren</i> . (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or <i>explicitWidth</i> properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selected</i>	whether the button is in the down state, and false if it is in the up state. (Inherited from <i>SparkToggleButtonBase</i>)
<i>showsCaret</i>	a value whether the item renderer can show itself as focused.
<i>stickyHighlighting</i>	a value whether the button displays its down skin when the user presses it but changes to its over skin when the user drags the mouse off of it. (Inherited from <i>SparkButtonBase</i>)

Name	Description
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from FlexDisplayObject)
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TestObject)
themeColor	the theme color of a component. (Inherited from FlexObject)
toolTip	the text to display in the ToolTip. The default value is Nothing. (Inherited from FlexObject)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from FlexObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	The event triggered when a drag operation is cancelled. (Inherited from SparkToggleButton)

Name	Description
DragDrop	The event triggered when the dragged item is dropped. (Inherited from SparkToggleButton)
DragStart	The event triggered when the drag/drop operation begins. (Inherited from SparkToggleButton)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)

Name	Description
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key. (Inherited from SparkButtonBase)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
<i>WaitForDisappearance</i>	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>) Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <i>OPT_WAIT_RESOLVE_OBJDEF</i> . Use <i>WaitForObject</i> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <i>WaitForObject</i> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <i>WaitForObject</i> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

SparkButtonBase Class

Description

The SparkButtonBase class is the base class for the all Spark button components.

Inheritance Hierarchy

- [*SparkObject*](#)
 - SparkButtonBase
 - [*SparkButton*](#)
 - [*SparkToggleButtonBase*](#)

Syntax

```
'Declaration  
Public Class SparkButtonBase _  
Inherits SparkObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
autoRepeat	whether to dispatch repeated buttonDown events if the user holds down the mouse button.
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
currentState	the current view state of the component. (Inherited from FlexObject)
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from FlexObject)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from FlexObject)
height	the height of the display object, in pixels. (Inherited from FlexDisplayObject)
id	the ID of the component. (Inherited from FlexObject)
label	the text to appear on the ButtonBase control.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from FlexDisplayObject)
numAutomationChildren	the number of automation children this container has. (Inherited from FlexObject)

Name	Description
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from FlexObject)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from FlexObject)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from FlexObject)
scaleY	the number that specifies the vertical scaling factor. (Inherited from FlexObject)
stickyHighlighting	a value whether the button displays its down skin when the user presses it but changes to its over skin when the user drags the mouse off of it.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from FlexDisplayObject)
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TestObject)
themeColor	the theme color of a component. (Inherited from FlexObject)
toolTip	the text to display in the ToolTip. The default value is Nothing. (Inherited from FlexObject)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from FlexObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location

Name	Description
	<p>on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)</p>
<i>ChangeFocus</i>	Changes the current focus. (Inherited from <i>FlexObject</i>)
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i>)
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i>)
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. <i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>GetStyle</i>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <i>FlexDisplayObject</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)

Name	Description
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject . (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)

Name	Description
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkCheckBox Class

Description

The `CheckBox` component consists of an optional label and a small box that can contain a check mark or not.

Inheritance Hierarchy

- [SparkToggleButtonBase](#)
 - SparkCheckBox

Syntax

```
'Declaration
Public Class SparkCheckBox _
Inherits SparkToggleButtonBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
autoRepeat	whether to dispatch repeated buttonDown events if the user holds down the mouse button. (Inherited from SparkButtonBase)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
currentState	the current view state of the component. (Inherited from FlexObject)
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from FlexObject)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from FlexObject)
height	the height of the display object, in pixels. (Inherited from FlexDisplayObject)
id	the ID of the component. (Inherited from FlexObject)
label	the text to appear on the ButtonBase control. (Inherited from SparkButtonBase)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list,

Name	Description
	use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selected</i>	whether the button is in the down state, and false if it is in the up state. (Inherited from <i>SparkToggleButtonBase</i>)
<i>stickyHighlighting</i>	a value whether the button displays its down skin when the user presses it but changes to its over skin when the user drags the mouse off of it. (Inherited from <i>SparkButtonBase</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Name	Description
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	The event triggered when a drag operation is cancelled.
DragDrop	The event triggered when the dragged item is dropped.
DragStart	The event triggered when the drag/drop operation begins.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)

Name	Description
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)

Name	Description
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key. (Inherited from SparkButtonBase)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkComboBox Class

Description

The ComboBox control is a child class of the DropDownListBase control. Like the DropDownListBase control, when the user selects an item from the drop-down list in the ComboBox control, the data item appears in the prompt area of the control.

Inheritance Hierarchy

- [SparkDropDownListBase](#)
 - SparkComboBox

Syntax

```
'Declaration
Public Class SparkComboBox _
Inherits SparkDropDownListBase
```

Properties

Name	Description
allowMultipleSelection	a value if multiple selection is enabled. (Inherited from SparkList)
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
autoLayout	the measurement and layout are done when the position or size of a child is changed. (Inherited from SparkSkinnableDataContainer)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
caretIndex	The item that is currently in focus. (Inherited from SparkListBase)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
columnNames	a list containing the names of all columns in the data. (Inherited from SparkSkinnableContainerBase)

Name	Description
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>dragEnabled</i>	A flag that indicates whether you can drag items out of this control and drop them on other controls. (Inherited from <i>SparkList</i>)
<i>dragMoveEnabled</i>	A flag that indicates whether items can be moved instead of just copied from the control as part of a drag-and-drop operation. (Inherited from <i>SparkList</i>)
<i>dropEnabled</i>	A flag that indicates whether dragged items can be dropped onto the control. (Inherited from <i>SparkList</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>isDropDownOpen</i>	a value whether the drop down is open. (Inherited from <i>SparkDropDownListBase</i>)
<i>labelField</i>	The name of the field in the data provider items to display as the label. (Inherited from <i>SparkListBase</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>maxChars</i>	The maximum number of characters that the prompt area can contain, as entered by a user.
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use <code>flash.display.DisplayObjectContainer.mouseChildren</code> . (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>SparkSkinnableContainerBase</i>)

Name	Description
numRows	the total number of rows of data available. (Inherited from SparkSkinnableContainerBase)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from FlexObject)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from FlexObject)
requireSelection	a value if a data item must always be selected in the control (Inherited from SparkListBase)
restrict	The set of characters that a user can enter into the prompt area.
scaleX	the number that specifies the horizontal scaling factor. (Inherited from FlexObject)
scaleY	the number that specifies the vertical scaling factor. (Inherited from FlexObject)
selectedIndex	The 0-based index of the selected item, or -1 if no item is selected. (Inherited from SparkListBase)
selectedIndices	a list representing the indices of the currently selected item or items. (Inherited from SparkList)
selectedItem	The item that is currently selected. (Inherited from SparkListBase)
selectedItems	a list of Objects representing the currently selected data items. (Inherited from SparkList)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from FlexDisplayObject)
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TextObject)
themeColor	the theme color of a component. (Inherited from FlexObject)
toolTip	the text to display in the ToolTip. The default value is Nothing. (Inherited from FlexObject)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from FlexObject)
useVirtualLayout	the value of the useVirtualLayout property of the layout associated with this control. (Inherited from SparkListBase)
Value	The value of the control, e.g.: text in a text control. (Inherited from TextObject)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)

Name	Description
<i>width</i>	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from SparkSkinnableContainerBase)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from SparkSkinnableContainerBase)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from SparkSkinnableContainerBase)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)

Name	Description
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>GetItemCount</i>	Gets the number of items in the ComboBox. (Inherited from <i>SparkListBase</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>GetStyle</i>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <i>FlexDisplayObject</i>)
<i>GetValues</i>	Returns a matrix containing the automation values of all parts of the components. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Input</i>	Dispatched when the user types, deletes, or pastes text into the control.
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>Move</i>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <i>FlexObject</i>)

Name	Description
Open	Dispatched when the user clicks the drop-down button to display the drop-down list. (Inherited from SparkDropDownListBase)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Select	Dispatched when an item in the list is selected. (Inherited from SparkListBase)
SelectIndex	Dispatched when the user clicks on an item in the list or navigates to the item using a keyboard. (Inherited from SparkList)
SelectText	Dispatched when text is selected.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key. (Inherited from SparkListBase)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
WaitForObject	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject) Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkComplexDisplay Class

Description

A complex rendered object.

Inheritance Hierarchy

- [SparkListLabel](#)
 - SparkComplexDisplay

Syntax

```
'Declaration
Public Class SparkComplexDisplay _
Inherits SparkListLabel
```

Properties

Name	Description
<i>alpha</i>	the alpha transparency value of the object specified. (Inherited from <i>FlexDisplayObject</i>)
<i>autoLayout</i>	a value whether measurement and layout are done when the position or size of a child is changed. (Inherited from <i>SparkGroupBase</i>)
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i>)
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>automationValue</i>	A value which can be used to uniquely identify this item. (Inherited from <i>SparkListLabel</i>)
<i>blendMode</i>	A value from the BlendMode class that specifies which blend mode to use. (Inherited from <i>SparkGroup</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>clipAndEnableScrolling</i>	a value whether to clip the children to the boundaries of the viewport. (Inherited from <i>SparkGroupBase</i>)
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>SparkGroupBase</i>)
<i>contentHeight</i>	The height of the viewport's content. (Inherited from <i>SparkGroupBase</i>)
<i>contentWidth</i>	The width of the viewport's contents. (Inherited from <i>SparkGroupBase</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>dragging</i>	a value whether the SparkListLabel is in dragging mode. (Inherited from <i>SparkListLabel</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>SparkGroupBase</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)

Name	Description
<i>horizontalScrollPosition</i>	The x coordinate of the origin of the viewport in the component's coordinate system, where the default value is (0,0) corresponding to the upper-left corner of the component (Inherited from <i>SparkGroupBase</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>label</i>	the label of the SparkListLabel. (Inherited from <i>SparkListLabel</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>SparkGroupBase</i>)
<i>luminosityClip</i>	a value whether the luminosity mask clips the masked content. (Inherited from <i>SparkGroupBase</i>)
<i>luminosityInvert</i>	a value that controls the calculation of the RGB color value of a graphic element being masked by a luminosity mask. (Inherited from <i>SparkGroupBase</i>)
<i>maskType</i>	The mask type. (Inherited from <i>SparkGroupBase</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>mouseEnabledWhereTransparent</i>	a value whether the entire bounds of the Group respond to mouse events such as click and roll over. (Inherited from <i>SparkGroupBase</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>SparkGroupBase</i>)
<i>numElements</i>	The number of visual elements in this container. (Inherited from <i>SparkGroupBase</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>SparkGroupBase</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>resizeMode</i>	The ResizeMode for this container. (Inherited from <i>SparkGroupBase</i>)
<i>scaleGridBottom</i>	the bottom coordinate of the scale grid. (Inherited from <i>SparkGroup</i>)
<i>scaleGridLeft</i>	the left coordinate of the scale grid. (Inherited from <i>SparkGroup</i>)

Name	Description
<i>scaleGridRight</i>	the right coordinate of the scale grid. (Inherited from <i>SparkGroup</i>)
<i>scaleGridTop</i>	the top coordinate of the scale grid. (Inherited from <i>SparkGroup</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selected</i>	a value whether the SparkListLabel is selected. (Inherited from <i>SparkListLabel</i>)
<i>showsCaret</i>	a value whether the caret is shown. (Inherited from <i>SparkListLabel</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>verticalScrollPosition</i>	The y coordinate of the origin of the viewport in the component's coordinate system, where the default value is (0,0) corresponding to the upper-left corner of the component. (Inherited from <i>SparkGroupBase</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from SparkGroupBase)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from SparkGroupBase)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from SparkGroupBase)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject . (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from SparkGroupBase)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MouseScroll	Dispatched when the mouse is used to move the scroll bars on this container. (Inherited from SparkGroupBase)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Scroll	Dispatched when the container's scroll events occur. This event is dispatched if the scrolling is done programmatically or by the user. (Inherited from SparkGroupBase)

Name	Description
<i>SetFocus</i>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <i>FlexObject</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>Tostring</i>	Returns a string representation of the control. (Inherited from <i>FlexDisplayObject</i>)
<i>Type</i>	Dispatched when the user presses a key. (Inherited from <i>SparkGroupBase</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

Name	Description
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkDataGrid Class

Description

Identifies a Spark data grid control.

Inheritance Hierarchy

- [SparkSkinnableContainerBase](#)
 - SparkDataGrid

Syntax

```
'Declaration
Public Class SparkDataGrid _
Inherits SparkSkinnableContainerBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
columnNames	a list containing the names of all columns in the data. (Inherited from SparkSkinnableContainerBase)
columnsLength	the count of the columns.

Name	Description
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>rowHeight</i>	the height of the row.
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)

Name	Description
<i>selectedCell</i>	the selected cell.
<i>selectedCells</i>	the selected cells.
<i>selectedIndex</i>	the index of the selected row.
<i>selectedIndices</i>	the indices of the selected rows.
<i>selectedItem</i>	the item of the selected row.
<i>selectedItems</i>	the items of the selected rows.
<i>selectionLength</i>	the number of selected rows.
<i>selectionMode</i>	the selection mode (singlerow, multiplerows, singlecells or multiplecells).
<i>showDataTips</i>	whether data tips should be shown.
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location

Name	Description
	<p>on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)</p>
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
ColumnStretch	Stretches the given column of the data grid.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from SparkSkinnableContainerBase)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from SparkSkinnableContainerBase)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from SparkSkinnableContainerBase)
EditNext	Sets the following data grid cell in the edit mode.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from SparkSkinnableContainerBase)
HeaderClick	Clicks on the specified column header.
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Select	Selects the specified data grid cell.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)

Name	Description
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>ToString</i>	Returns a string representation of the control. (Inherited from <i>FlexDisplayObject</i>)
<i>Type</i>	Dispatched when the user presses a key.
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used.

Name	Description
	An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkDataGridLabel Class

Description

Identifies a spark data grid label control.

Inheritance Hierarchy

- [FlexObject](#)
 - SparkDataGridLabel

Syntax

```
'Declaration
Public Class SparkDataGridLabel _
Inherits FlexObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
automationValue	A value which can be used to uniquely identify this item.
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
currentState	the current view state of the component. (Inherited from FlexObject)
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)

Name	Description
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)

Name	Description
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>ChangeFocus</i>	Changes the current focus. (Inherited from <i>FlexObject</i>)
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i>)
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i>)
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <i>TestObject</i>)

Name	Description
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)

Name	Description
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout

Name	Description
	specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkDataGroup Class

Description

The DataGroup class is the base container class for data items.

Inheritance Hierarchy

- [SparkGroupBase](#)
 - SparkDataGroup

Syntax

```
'Declaration
Public Class SparkDataGroup _
Inherits SparkGroupBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
autoLayout	a value whether measurement and layout are done when the position or size of a child is changed. (Inherited from SparkGroupBase)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
clipAndEnableScrolling	a value whether to clip the children to the boundaries of the viewport. (Inherited from SparkGroupBase)
columnNames	a list containing the names of all columns in the data. (Inherited from SparkGroupBase)

Name	Description
<i>contentHeight</i>	The height of the viewport's content. (Inherited from <i>SparkGroupBase</i>)
<i>contentWidth</i>	The width of the viewport's contents. (Inherited from <i>SparkGroupBase</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>SparkGroupBase</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>horizontalScrollPosition</i>	The x coordinate of the origin of the viewport in the component's coordinate system, where the default value is (0,0) corresponding to the upper-left corner of the component (Inherited from <i>SparkGroupBase</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>SparkGroupBase</i>)
<i>luminosityClip</i>	a value whether the luminosity mask clips the masked content. (Inherited from <i>SparkGroupBase</i>)
<i>luminosityInvert</i>	a value that controls the calculation of the RGB color value of a graphic element being masked by a luminosity mask. (Inherited from <i>SparkGroupBase</i>)
<i>maskType</i>	The mask type. (Inherited from <i>SparkGroupBase</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use <code>flash.display.DisplayObjectContainer.mouseChildren</code> . (Inherited from <i>FlexDisplayObject</i>)
<i>mouseEnabledWhereTransparent</i>	a value whether the entire bounds of the Group respond to mouse events such as click and roll over. (Inherited from <i>SparkGroupBase</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)

Name	Description
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>SparkGroupBase</i>)
<i>numElements</i>	The number of visual elements in this container. (Inherited from <i>SparkGroupBase</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>SparkGroupBase</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>resizeMode</i>	The ResizeMode for this container. (Inherited from <i>SparkGroupBase</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>verticalScrollPosition</i>	The y coordinate of the origin of the viewport in the component's coordinate system, where the default value is (0,0) corresponding to the upper-left corner of the component. (Inherited from <i>SparkGroupBase</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)

Name	Description
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from SparkGroupBase)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from SparkGroupBase)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from SparkGroupBase)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from SparkGroupBase)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MouseScroll	Dispatched when the mouse is used to move the scroll bars on this container. (Inherited from SparkGroupBase)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Scroll	Dispatched when the container's scroll events occur. This event is dispatched if the scrolling is done programmatically or by the user. (Inherited from SparkGroupBase)
Select	Dispatched when one or more items in the list are deselected.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key. (Inherited from SparkGroupBase)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object,

Name	Description
	for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkDataRenderer Class

Description

The `SparkDataRenderer` class is the base class for data components in spark.

Inheritance Hierarchy

- [SparkGroup](#)
 - `SparkDataRenderer`
 - [SparkListLabel](#)

Syntax

```
'Declaration
Public Class SparkDataRenderer _
Inherits SparkGroup
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
autoLayout	a value whether measurement and layout are done when the position or size of a child is changed. (Inherited from SparkGroupBase)

Name	Description
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i>)
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>blendMode</i>	A value from the BlendMode class that specifies which blend mode to use. (Inherited from <i>SparkGroup</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>clipAndEnableScrolling</i>	a value whether to clip the children to the boundaries of the viewport. (Inherited from <i>SparkGroupBase</i>)
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>SparkGroupBase</i>)
<i>contentHeight</i>	The height of the viewport's content. (Inherited from <i>SparkGroupBase</i>)
<i>contentWidth</i>	The width of the viewport's contents. (Inherited from <i>SparkGroupBase</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>SparkGroupBase</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>horizontalScrollPosition</i>	The x coordinate of the origin of the viewport in the component's coordinate system, where the default value is (0,0) corresponding to the upper-left corner of the component (Inherited from <i>SparkGroupBase</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>SparkGroupBase</i>)
<i>luminosityClip</i>	a value whether the luminosity mask clips the masked content. (Inherited from <i>SparkGroupBase</i>)

Name	Description
<i>luminosityInvert</i>	a value that controls the calculation of the RGB color value of a graphic element being masked by a luminosity mask. (Inherited from <i>SparkGroupBase</i>)
<i>maskType</i>	The mask type. (Inherited from <i>SparkGroupBase</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>mouseEnabledWhereTransparent</i>	a value whether the entire bounds of the Group respond to mouse events such as click and roll over. (Inherited from <i>SparkGroupBase</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>SparkGroupBase</i>)
<i>numElements</i>	The number of visual elements in this container. (Inherited from <i>SparkGroupBase</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>SparkGroupBase</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>resizeMode</i>	The ResizeMode for this container. (Inherited from <i>SparkGroupBase</i>)
<i>scaleGridBottom</i>	the bottom coordinate of the scale grid. (Inherited from <i>SparkGroup</i>)
<i>scaleGridLeft</i>	the left coordinate of the scale grid. (Inherited from <i>SparkGroup</i>)
<i>scaleGridRight</i>	the right coordinate of the scale grid. (Inherited from <i>SparkGroup</i>)
<i>scaleGridTop</i>	the top coordinate of the scale grid. (Inherited from <i>SparkGroup</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)

Name	Description
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TestObject)
themeColor	the theme color of a component. (Inherited from FlexObject)
toolTip	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from FlexObject)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is <code>true</code> . If <code>useHandCursor</code> is <code>false</code> , the arrow pointer is used instead. (Inherited from FlexObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
verticalScrollPosition	The y coordinate of the origin of the viewport in the component's coordinate system, where the default value is (0,0) corresponding to the upper-left corner of the component. (Inherited from SparkGroupBase)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)

Name	Description
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from SparkGroupBase)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from SparkGroupBase)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from SparkGroupBase)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from SparkGroupBase)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)

Name	Description
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MouseScroll	Dispatched when the mouse is used to move the scroll bars on this container. (Inherited from SparkGroupBase)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Scroll	Dispatched when the container's scroll events occur. This event is dispatched if the scrolling is done programmatically or by the user. (Inherited from SparkGroupBase)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)

Name	Description
Type	Dispatched when the user presses a key. (Inherited from SparkGroupBase)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkDropDownList Class

Description

The `SparkDropDownList` control contains a drop-down list from which the user can select a single value.

Inheritance Hierarchy

- [SparkDropDownListBase](#)
 - SparkDropDownList

Syntax

```
'Declaration  
Public Class SparkDropDownList _  
Inherits SparkDropDownListBase
```

Properties

Name	Description
allowMultipleSelection	a value if multiple selection is enabled. (Inherited from SparkList)
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
autoLayout	the measurement and layout are done when the position or size of a child is changed. (Inherited from SparkSkinnableDataContainer)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
caretIndex	The item that is currently in focus. (Inherited from SparkListBase)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
columnNames	a list containing the names of all columns in the data. (Inherited from SparkSkinnableContainerBase)
currentState	the current view state of the component. (Inherited from FlexObject)
dragEnabled	A flag that indicates whether you can drag items out of this control and drop them on other controls. (Inherited from SparkList)
dragMoveEnabled	A flag that indicates whether items can be moved instead of just copied from the control as part of a drag-and-drop operation. (Inherited from SparkList)
dropEnabled	A flag that indicates whether dragged items can be dropped onto the control. (Inherited from SparkList)
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from FlexObject)

Name	Description
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>isDropDownOpen</i>	a value whether the drop down is open. (Inherited from <i>SparkDropDownListBase</i>)
<i>labelField</i>	The name of the field in the data provider items to display as the label. (Inherited from <i>SparkListBase</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>prompt</i>	The prompt for the DropDownList control.
<i>requireSelection</i>	a value if a data item must always be selected in the control (Inherited from <i>SparkListBase</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectedIndex</i>	The 0-based index of the selected item, or -1 if no item is selected. (Inherited from <i>SparkListBase</i>)

Name	Description
<i>selectedIndices</i>	a list representing the indices of the currently selected item or items. (Inherited from <i>SparkList</i>)
<i>selectedItem</i>	The item that is currently selected. (Inherited from <i>SparkListBase</i>)
<i>selectedItems</i>	a list of Objects representing the currently selected data items. (Inherited from <i>SparkList</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <code>useHandCursor</code> is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>useVirtualLayout</i>	the value of the <code>useVirtualLayout</code> property of the layout associated with this control. (Inherited from <i>SparkListBase</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant

Name	Description
	<i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from SparkSkinnableContainerBase)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from SparkSkinnableContainerBase)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from SparkSkinnableContainerBase)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetItemsCount	Gets the number of items in the ComboBox. (Inherited from SparkListBase)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)

Name	Description
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from SparkSkinnableContainerBase)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
Open	Dispatched when the user clicks the drop-down button to display the drop-down list. (Inherited from SparkDropDownListBase)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Select	Dispatched when an item in the list is selected. (Inherited from SparkListBase)
SelectIndex	Dispatched when the user clicks on an item in the list or navigates to the item using a keyboard. (Inherited from SparkList)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)

Name	Description
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key. (Inherited from SparkListBase)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkDropDownListBase Class

Description

The SparkDropDownListBase control contains a drop-down list from which the user can select a single value.

Inheritance Hierarchy

- [SparkList](#)
 - SparkDropDownListBase
 - [SparkComboBox](#)
 - [SparkDropDownList](#)

Syntax

```
'Declaration
Public Class SparkDropDownListBase _
Inherits SparkList
```

Properties

Name	Description
allowMultipleSelection	a value if multiple selection is enabled. (Inherited from SparkList)
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
autoLayout	the measurement and layout are done when the position or size of a child is changed. (Inherited from SparkSkinnableDataContainer)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
caretIndex	The item that is currently in focus. (Inherited from SparkListBase)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
columnNames	a list containing the names of all columns in the data. (Inherited from SparkSkinnableContainerBase)

Name	Description
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>dragEnabled</i>	A flag that indicates whether you can drag items out of this control and drop them on other controls. (Inherited from <i>SparkList</i>)
<i>dragMoveEnabled</i>	A flag that indicates whether items can be moved instead of just copied from the control as part of a drag-and-drop operation. (Inherited from <i>SparkList</i>)
<i>dropEnabled</i>	A flag that indicates whether dragged items can be dropped onto the control. (Inherited from <i>SparkList</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>isDropDownOpen</i>	a value whether the drop down is open.
<i>labelField</i>	The name of the field in the data provider items to display as the label. (Inherited from <i>SparkListBase</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>SparkSkinnableContainerBase</i>)

Name	Description
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from FlexObject)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from FlexObject)
requireSelection	a value if a data item must always be selected in the control (Inherited from SparkListBase)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from FlexObject)
scaleY	the number that specifies the vertical scaling factor. (Inherited from FlexObject)
selectedIndex	The 0-based index of the selected item, or -1 if no item is selected. (Inherited from SparkListBase)
selectedIndices	a list representing the indices of the currently selected item or items. (Inherited from SparkList)
selectedItem	The item that is currently selected. (Inherited from SparkListBase)
selectedItems	a list of Objects representing the currently selected data items. (Inherited from SparkList)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from FlexDisplayObject)
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TextObject)
themeColor	the theme color of a component. (Inherited from FlexObject)
toolTip	the text to display in the ToolTip. The default value is Nothing. (Inherited from FlexObject)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from FlexObject)
useVirtualLayout	the value of the useVirtualLayout property of the layout associated with this control. (Inherited from SparkListBase)
Value	The value of the control, e.g.: text in a text control. (Inherited from TextObject)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)

Name	Description
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from SparkSkinnableContainerBase)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from SparkSkinnableContainerBase)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from SparkSkinnableContainerBase)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)

Name	Description
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>GetItemsCount</i>	Gets the number of items in the ComboBox. (Inherited from <i>SparkListBase</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>GetStyle</i>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <i>FlexDisplayObject</i>)
<i>GetValues</i>	Returns a matrix containing the automation values of all parts of the components. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>Move</i>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <i>FlexObject</i>)
<i>Open</i>	Dispatched when the user clicks the drop-down button to display the drop-down list.

Name	Description
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>Select</i>	Dispatched when an item in the list is selected. (Inherited from <i>SparkListBase</i>)
<i>SelectIndex</i>	Dispatched when the user clicks on an item in the list or navigates to the item using a keyboard. (Inherited from <i>SparkList</i>)
<i>SetFocus</i>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <i>FlexObject</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>ToString</i>	Returns a string representation of the control. (Inherited from <i>FlexDisplayObject</i>)
<i>Type</i>	Dispatched when the user presses a key. (Inherited from <i>SparkListBase</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown.

Name	Description
	The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkForm Class

Description

Identifies a Spark form control.

Inheritance Hierarchy

- [SparkSkinnableContainer](#)
 - SparkForm

Syntax

```
'Declaration
Public Class SparkForm _
Inherits SparkSkinnableContainer
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)

Name	Description
<i>autoLayout</i>	whether measurement and layout are done when the position or size of a child is changed. (Inherited from <i>SparkSkinnableContainer</i>)
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i>)
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>creationPolicy</i>	the content creation policy for this component. (Inherited from <i>SparkSkinnableContainer</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>deferredContentCreated</i>	whether deferred content has been created. (Inherited from <i>SparkSkinnableContainer</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any <i>InteractiveObject</i> instance that is on the display list receives mouse events. If <i>mouseEnabled</i> is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the <i>mouseEnabled</i> behavior for all children of an object on the display list, use <i>flash.display.DisplayObjectContainer.mouseChildren</i> . (Inherited from <i>FlexDisplayObject</i>)

Name	Description
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>numElements</i>	The number of visual elements in this container. (Inherited from <i>SparkSkinnableContainer</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from SparkSkinnableContainerBase)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from SparkSkinnableContainerBase)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from SparkSkinnableContainerBase)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject . (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from SparkSkinnableContainerBase)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)

Name	Description
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If

Name	Description
	you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkFormItem Class

Description

Identifies a Spark form item control.

Inheritance Hierarchy

- [SparkSkinnableContainer](#)
 - SparkFormItem

Syntax

```
'Declaration
Public Class SparkFormItem _
Inherits SparkSkinnableContainer
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
autoLayout	whether measurement and layout are done when the position or size of a child is changed. (Inherited from SparkSkinnableContainer)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
columnNames	a list containing the names of all columns in the data. (Inherited from SparkSkinnableContainerBase)
creationPolicy	the content creation policy for this component. (Inherited from SparkSkinnableContainer)
currentState	the current view state of the component. (Inherited from FlexObject)
deferredContentCreated	whether deferred content has been created. (Inherited from SparkSkinnableContainer)

Name	Description
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>label</i>	the text of the form items label.
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>numElements</i>	The number of visual elements in this container. (Inherited from <i>SparkSkinnableContainer</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>required</i>	whether the form item has to have a value to submit the form.
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)

Name	Description
scaleY	the number that specifies the vertical scaling factor. (Inherited from FlexObject)
sequenceLabel	the number of the form item in the form.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from FlexDisplayObject)
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TestObject)
themeColor	the theme color of a component. (Inherited from FlexObject)
toolTip	the text to display in the ToolTip. The default value is Nothing. (Inherited from FlexObject)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from FlexObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)

Name	Description
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from SparkSkinnableContainerBase)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from SparkSkinnableContainerBase)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from SparkSkinnableContainerBase)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from SparkSkinnableContainerBase)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)

Name	Description
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject . (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)

Name	Description
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

SparkGroup Class

Description

Use this container when you want to manage visual children, both visual components and graphical components.

Inheritance Hierarchy

- [SparkGroupBase](#)
 - SparkGroup
 - [SparkDataRenderer](#)
 - [SparkTileGroup](#)

Syntax

```
'Declaration
Public Class SparkGroup _
Inherits SparkGroupBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
autoLayout	a value whether measurement and layout are done when the position or size of a child is changed. (Inherited from SparkGroupBase)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
blendMode	A value from the BlendMode class that specifies which blend mode to use.
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
clipAndEnableScrolling	a value whether to clip the children to the boundaries of the viewport. (Inherited from SparkGroupBase)
columnNames	a list containing the names of all columns in the data. (Inherited from SparkGroupBase)
contentHeight	The height of the viewport's content. (Inherited from SparkGroupBase)
contentWidth	The width of the viewport's contents. (Inherited from SparkGroupBase)
currentState	the current view state of the component. (Inherited from FlexObject)
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from FlexObject)

Name	Description
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>SparkGroupBase</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>horizontalScrollPosition</i>	The x coordinate of the origin of the viewport in the component's coordinate system, where the default value is (0,0) corresponding to the upper-left corner of the component (Inherited from <i>SparkGroupBase</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>SparkGroupBase</i>)
<i>luminosityClip</i>	a value whether the luminosity mask clips the masked content. (Inherited from <i>SparkGroupBase</i>)
<i>luminosityInvert</i>	a value that controls the calculation of the RGB color value of a graphic element being masked by a luminosity mask. (Inherited from <i>SparkGroupBase</i>)
<i>maskType</i>	The mask type. (Inherited from <i>SparkGroupBase</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>mouseEnabledWhereTransparent</i>	a value whether the entire bounds of the Group respond to mouse events such as click and roll over. (Inherited from <i>SparkGroupBase</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>SparkGroupBase</i>)
<i>numElements</i>	The number of visual elements in this container. (Inherited from <i>SparkGroupBase</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>SparkGroupBase</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>resizeMode</i>	The ResizeMode for this container. (Inherited from <i>SparkGroupBase</i>)

Name	Description
<i>scaleGridBottom</i>	the bottom coordinate of the scale grid.
<i>scaleGridLeft</i>	the left coordinate of the scale grid.
<i>scaleGridRight</i>	the right coordinate of the scale grid.
<i>scaleGridTop</i>	the top coordinate of the scale grid.
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is <i>Nothing</i> . (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <i>useHandCursor</i> is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>verticalScrollPosition</i>	The y coordinate of the origin of the viewport in the component's coordinate system, where the default value is (0,0) corresponding to the upper-left corner of the component. (Inherited from <i>SparkGroupBase</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from SparkGroupBase)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from SparkGroupBase)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from SparkGroupBase)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject . (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from SparkGroupBase)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MouseScroll	Dispatched when the mouse is used to move the scroll bars on this container. (Inherited from SparkGroupBase)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Scroll	Dispatched when the container's scroll events occur. This event is dispatched if the scrolling is done programmatically or by the user. (Inherited from SparkGroupBase)

Name	Description
<i>SetFocus</i>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <i>FlexObject</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>Tostring</i>	Returns a string representation of the control. (Inherited from <i>FlexDisplayObject</i>)
<i>Type</i>	Dispatched when the user presses a key. (Inherited from <i>SparkGroupBase</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

Name	Description
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

SparkGroupBase Class

Description

The GroupBase class defines the base class for components that display visual elements.

Inheritance Hierarchy

- [*FlexObject*](#)
 - SparkGroupBase
 - [*SparkDataGroup*](#)
 - [*SparkGroup*](#)

Syntax

```
'Declaration
Public Class SparkGroupBase _
Inherits FlexObject
```

Properties

Name	Description
<i>alpha</i>	the alpha transparency value of the object specified. (Inherited from <i>FlexDisplayObject</i>)
<i>autoLayout</i>	a value whether measurement and layout are done when the position or size of a child is changed.
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i>)
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)

Name	Description
<i>clipAndEnableScrolling</i>	a value whether to clip the children to the boundaries of the viewport.
<i>columnNames</i>	a list containing the names of all columns in the data.
<i>contentHeight</i>	The height of the viewport's content.
<i>contentWidth</i>	The width of the viewport's contents.
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child.
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>horizontalScrollPosition</i>	The x coordinate of the origin of the viewport in the component's coordinate system, where the default value is (0,0) corresponding to the upper-left corner of the component
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>lastVisibleRow</i>	the index of the last visible child.
<i>luminosityClip</i>	a value whether the luminosity mask clips the masked content.
<i>luminosityInvert</i>	a value that controls the calculation of the RGB color value of a graphic element being masked by a luminosity mask.
<i>maskType</i>	The mask type.
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use <code>flash.display.DisplayObjectContainer.mouseChildren</code> . (Inherited from <i>FlexDisplayObject</i>)
<i>mouseEnabledWhereTransparent</i>	a value whether the entire bounds of the Group respond to mouse events such as click and roll over.
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available.
<i>numElements</i>	The number of visual elements in this container.

Name	Description
<i>numRows</i>	the total number of rows of data available.
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>resizeMode</i>	The ResizeMode for this container.
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>verticalScrollPosition</i>	The y coordinate of the origin of the viewport in the component's coordinate system, where the default value is (0,0) corresponding to the upper-left corner of the component.
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Dispatched when a drag operation is cancelled.
DragDrop	Dispatched when the dragged item is dropped.
DragStart	Dispatched when the drag/drop operation begins.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject . (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)

Name	Description
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components.
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MouseScroll	Dispatched when the mouse is used to move the scroll bars on this container.
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Scroll	Dispatched when the container's scroll events occur. This event is dispatched if the scrolling is done programmatically or by the user.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)

Name	Description
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkImage Class

Description

Identifies a Spark image control.

Inheritance Hierarchy

- [SparkObject](#)
 - SparkImage

Syntax

```
'Declaration
Public Class SparkImage _
Inherits SparkObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
bytesLoaded	the number of bytes of the image already loaded.
bytesTotal	the total image data in bytes loaded or pending load.
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
clearOnLoad	whether or not to clear previous image content prior to loading new content.
contentLoaderGrouping	the optional content grouping identifier to pass to the an associated <code>IContentLoader</code> instance's <code>load()</code> method.
currentState	the current view state of the component. (Inherited from FlexObject)

Name	Description
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>fillMode</i>	a value how the bitmap fills in the dimensions.
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>horizontalAlign</i>	the horizontal alignment of the content when it does not have a one-to-one aspect ratio and <code>scaleMode</code> is set to <code>BitmapScaleMode.LETTERBOX</code> .
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any <code>InteractiveObject</code> instance that is on the display list receives mouse events. If <code>mouseEnabled</code> is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the <code>mouseEnabled</code> behavior for all children of an object on the display list, use <code>flash.display.DisplayObjectContainer.mouseChildren</code> . (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or <code>explicitWidth</code> properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>preliminaryHeight</i>	an estimate to use for height when the "measured" bounds of the image is requested by layout, but the image data has yet to complete loading.
<i>preliminaryWidth</i>	an estimate to use for width when the "measured" bounds of the image is requested by layout, but the image data has yet to complete loading.
<i>scaleMode</i>	whether the image is scaled when <code>fillMode</code> is set to <code>BitmapFillMode.SCALE</code> .
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)

Name	Description
smooth	whether to apply a smoothing algorithm to the bitmap image.
source	the content location.
sourceHeight	the unscaled height of the original image data.
sourceWidth	the unscaled width of the original image data.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from FlexDisplayObject)
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TextObject)
themeColor	the theme color of a component. (Inherited from FlexObject)
toolTip	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from FlexObject)
trustedSource	a flag denoting whether the currently loaded content is considered loaded from a source whose security policy allows for cross domain image access.
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <code>useHandCursor</code> is false, the arrow pointer is used instead. (Inherited from FlexObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TextObject)
verticalAlign	the vertical alignment of the content when it does not have a one-to-one aspect ratio and <code>scaleMode</code> is set to <code>BitmapScaleMode.LETTERBOX</code> .
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from FlexDisplayObject)
y	the y coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored

Name	Description
	in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this <code>TestObject</code> . (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)

Name	Description
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>Move</i>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <i>FlexObject</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>SetFocus</i>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <i>FlexObject</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>ToString</i>	Returns a string representation of the control. (Inherited from <i>FlexDisplayObject</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)

Name	Description
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkLabel Class

Description

Label is a low-level UIComponent that can render one or more lines of uniformly-formatted text.

Inheritance Hierarchy

- [SparkTextBase](#)
 - SparkLabel

Syntax

```
'Declaration
Public Class SparkLabel _
Inherits SparkTextBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
currentState	the current view state of the component. (Inherited from FlexObject)
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from FlexObject)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from FlexObject)
height	the height of the display object, in pixels. (Inherited from FlexDisplayObject)
id	the ID of the component. (Inherited from FlexObject)
isTruncated	whether the text has been truncated. (Inherited from SparkTextBase)
maxDisplayedLines	An integer which determines whether, and where, the text gets truncated. (Inherited from SparkTextBase)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use <code>flash.display.DisplayObjectContainer.mouseChildren</code> . (Inherited from FlexDisplayObject)
numAutomationChildren	the number of automation children this container has. (Inherited from FlexObject)

Name	Description
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>text</i>	The text displayed by this text component. (Inherited from <i>SparkTextBase</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is <i>Nothing</i> . (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/

Name	Description
	<p>Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)</p>
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	The event triggered when a drag operation is cancelled. (Inherited from SparkTextBase)
DragDrop	The event triggered when the dragged item is dropped. (Inherited from SparkTextBase)
DragStart	The event triggered when the drag/drop operation begins. (Inherited from SparkTextBase)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)

GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)

Name	Description
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)

Name	Description
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key. (Inherited from SparkTextBase)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkList Class

Description

The List control displays a vertical list of items.

Inheritance Hierarchy

- [SparkListBase](#)
 - SparkList
 - [SparkDropDownListBase](#)

Syntax

```
'Declaration  
Public Class SparkList _  
Inherits SparkListBase
```

Properties

Name	Description
allowMultipleSelection	a value if multiple selection is enabled.
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
autoLayout	the measurement and layout are done when the position or size of a child is changed. (Inherited from SparkSkinnableDataContainer)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
caretIndex	The item that is currently in focus. (Inherited from SparkListBase)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
columnNames	a list containing the names of all columns in the data. (Inherited from SparkSkinnableContainerBase)
currentState	the current view state of the component. (Inherited from FlexObject)
dragEnabled	A flag that indicates whether you can drag items out of this control and drop them on other controls.
dragMoveEnabled	A flag that indicates whether items can be moved instead of just copied from the control as part of a drag-and-drop operation.
dropEnabled	A flag that indicates whether dragged items can be dropped onto the control.

Name	Description
<code>enabled</code>	whether the component can accept user interaction. (Inherited from FlexObject)
<code>errorColor</code>	the color of the component highlight when validation fails. (Inherited from FlexObject)
<code>errorString</code>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from FlexObject)
<code>firstVisibleRow</code>	the index of the first visible child. (Inherited from SparkSkinnableContainerBase)
<code>focusEnabled</code>	whether the component can receive focus when tabbed to. (Inherited from FlexObject)
<code>height</code>	the height of the display object, in pixels. (Inherited from FlexDisplayObject)
<code>id</code>	the ID of the component. (Inherited from FlexObject)
<code>labelField</code>	The name of the field in the data provider items to display as the label. (Inherited from SparkListBase)
<code>lastVisibleRow</code>	the index of the last visible child. (Inherited from SparkSkinnableContainerBase)
<code>mouseEnabled</code>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use <code>flash.display.DisplayObjectContainer.mouseChildren</code> . (Inherited from FlexDisplayObject)
<code>numAutomationChildren</code>	the number of automation children this container has. (Inherited from FlexObject)
<code>numColumns</code>	the total number of columns in the data available. (Inherited from SparkSkinnableContainerBase)
<code>numRows</code>	the total number of rows of data available. (Inherited from SparkSkinnableContainerBase)
<code>percentHeight</code>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from FlexObject)
<code>percentWidth</code>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from FlexObject)
<code>requireSelection</code>	a value if a data item must always be selected in the control (Inherited from SparkListBase)
<code>scaleX</code>	the number that specifies the horizontal scaling factor. (Inherited from FlexObject)
<code>scaleY</code>	the number that specifies the vertical scaling factor. (Inherited from FlexObject)

Name	Description
selectedIndex	The 0-based index of the selected item, or -1 if no item is selected. (Inherited from SparkListBase)
selectedIndices	a list representing the indices of the currently selected item or items.
selectedItem	The item that is currently selected. (Inherited from SparkListBase)
selectedItems	a list of Objects representing the currently selected data items.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from FlexDisplayObject)
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TestObject)
themeColor	the theme color of a component. (Inherited from FlexObject)
toolTip	the text to display in the ToolTip. The default value is Nothing. (Inherited from FlexObject)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from FlexObject)
useVirtualLayout	the value of the useVirtualLayout property of the layout associated with this control. (Inherited from SparkListBase)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant

Name	Description
	<i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from SparkSkinnableContainerBase)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from SparkSkinnableContainerBase)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from SparkSkinnableContainerBase)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetItemsCount	Gets the number of items in the ComboBox. (Inherited from SparkListBase)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)

Name	Description
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from SparkSkinnableContainerBase)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Select	Dispatched when an item in the list is selected. (Inherited from SparkListBase)
SelectIndex	Dispatched when the user clicks on an item in the list or navigates to the item using a keyboard.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)

Name	Description
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key. (Inherited from SparkListBase)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If

Name	Description
	you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkListBase Class

Description

The ListBase class is the base class for all components that support selection.

Inheritance Hierarchy

- [SparkSkinnableDataContainer](#)
 - SparkListBase
 - [SparkButtonBar](#)
 - [SparkList](#)
 - [SparkTabBar](#)

Syntax

```
'Declaration
Public Class SparkListBase _
Inherits SparkSkinnableDataContainer
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
autoLayout	the measurement and layout are done when the position or size of a child is changed. (Inherited from SparkSkinnableDataContainer)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
caretIndex	The item that is currently in focus.
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
columnNames	a list containing the names of all columns in the data. (Inherited from SparkSkinnableContainerBase)
currentState	the current view state of the component. (Inherited from FlexObject)

Name	Description
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>labelField</i>	The name of the field in the data provider items to display as the label.
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>requireSelection</i>	a value if a data item must always be selected in the control
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectedIndex</i>	The 0-based index of the selected item, or -1 if no item is selected.

Name	Description
<i>selectedItem</i>	The item that is currently selected.
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>useVirtualLayout</i>	the value of the useVirtualLayout property of the layout associated with this control.
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>ChangeFocus</i>	Changes the current focus. (Inherited from <i>FlexObject</i>)
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i>)

Name	Description
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from SparkSkinnableContainerBase)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from SparkSkinnableContainerBase)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from SparkSkinnableContainerBase)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetItemsCount	Gets the number of items in the ComboBox.
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from SparkSkinnableContainerBase)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)

Name	Description
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Select	Dispatched when an item in the list is selected.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)

Name	Description
Type	Dispatched when the user presses a key.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkListLabel Class

Description

A simple rendered object.

Inheritance Hierarchy

- [SparkDataRenderer](#)
 - SparkListLabel
 - [SparkComplexDisplay](#)

Syntax

```
'Declaration
Public Class SparkListLabel _
Inherits SparkDataRenderer
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
autoLayout	a value whether measurement and layout are done when the position or size of a child is changed. (Inherited from SparkGroupBase)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
automationValue	A value which can be used to uniquely identify this item.
blendMode	A value from the BlendMode class that specifies which blend mode to use. (Inherited from SparkGroup)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
clipAndEnableScrolling	a value whether to clip the children to the boundaries of the viewport. (Inherited from SparkGroupBase)
columnNames	a list containing the names of all columns in the data. (Inherited from SparkGroupBase)
contentHeight	The height of the viewport's content. (Inherited from SparkGroupBase)
contentWidth	The width of the viewport's contents. (Inherited from SparkGroupBase)
currentState	the current view state of the component. (Inherited from FlexObject)
dragging	a value whether the SparkListLabel is in dragging mode.
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)

Name	Description
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>SparkGroupBase</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>horizontalScrollPosition</i>	The x coordinate of the origin of the viewport in the component's coordinate system, where the default value is (0,0) corresponding to the upper-left corner of the component (Inherited from <i>SparkGroupBase</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>label</i>	the label of the SparkListLabel.
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>SparkGroupBase</i>)
<i>luminosityClip</i>	a value whether the luminosity mask clips the masked content. (Inherited from <i>SparkGroupBase</i>)
<i>luminosityInvert</i>	a value that controls the calculation of the RGB color value of a graphic element being masked by a luminosity mask. (Inherited from <i>SparkGroupBase</i>)
<i>maskType</i>	The mask type. (Inherited from <i>SparkGroupBase</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>mouseEnabledWhereTransparent</i>	a value whether the entire bounds of the Group respond to mouse events such as click and roll over. (Inherited from <i>SparkGroupBase</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>SparkGroupBase</i>)
<i>numElements</i>	The number of visual elements in this container. (Inherited from <i>SparkGroupBase</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>SparkGroupBase</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)

Name	Description
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from FlexObject)
resizeMode	The ResizeMode for this container. (Inherited from SparkGroupBase)
scaleGridBottom	the bottom coordinate of the scale grid. (Inherited from SparkGroup)
scaleGridLeft	the left coordinate of the scale grid. (Inherited from SparkGroup)
scaleGridRight	the right coordinate of the scale grid. (Inherited from SparkGroup)
scaleGridTop	the top coordinate of the scale grid. (Inherited from SparkGroup)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from FlexObject)
scaleY	the number that specifies the vertical scaling factor. (Inherited from FlexObject)
selected	a value whether the SparkListLabel is selected.
showsCaret	a value whether the caret is shown.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from FlexDisplayObject)
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TestObject)
themeColor	the theme color of a component. (Inherited from FlexObject)
toolTip	the text to display in the ToolTip. The default value is Nothing. (Inherited from FlexObject)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from FlexObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
verticalScrollPosition	The y coordinate of the origin of the viewport in the component's coordinate system, where the default value is (0,0) corresponding to the upper-left corner of the component. (Inherited from SparkGroupBase)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)

Name	Description
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>ChangeFocus</i>	Changes the current focus. (Inherited from <i>FlexObject</i>)
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i>)
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i>)
<i>DragCancel</i>	Dispatched when a drag operation is cancelled. (Inherited from <i>SparkGroupBase</i>)
<i>DragDrop</i>	Dispatched when the dragged item is dropped. (Inherited from <i>SparkGroupBase</i>)
<i>DragStart</i>	Dispatched when the drag/drop operation begins. (Inherited from <i>SparkGroupBase</i>)
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from SparkGroupBase)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MouseScroll	Dispatched when the mouse is used to move the scroll bars on this container. (Inherited from SparkGroupBase)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Scroll	Dispatched when the container's scroll events occur. This event is dispatched if the scrolling is done programmatically or by the user. (Inherited from SparkGroupBase)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key. (Inherited from SparkGroupBase)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a

Name	Description
	WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkMuteButton Class

Description

The MuteButton class defines the mute button used by the VideoPlayer control.

Inheritance Hierarchy

- [SparkButton](#)
 - SparkMuteButton

Syntax

```
'Declaration
Public Class SparkMuteButton _
Inherits SparkButton
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)

Name	Description
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>autoRepeat</i>	whether to dispatch repeated buttonDown events if the user holds down the mouse button. (Inherited from <i>SparkButtonBase</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>emphasized</i>	whether the default button as requested by the focus manager. (Inherited from <i>SparkButton</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>label</i>	the text to appear on the ButtonBase control. (Inherited from <i>SparkButtonBase</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>muted</i>	a value whether the control is muted.
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)

Name	Description
scaleY	the number that specifies the vertical scaling factor. (Inherited from FlexObject)
stickyHighlighting	a value whether the button displays its down skin when the user presses it but changes to its over skin when the user drags the mouse off of it. (Inherited from SparkButtonBase)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from FlexDisplayObject)
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TextObject)
themeColor	the theme color of a component. (Inherited from FlexObject)
toolTip	the text to display in the ToolTip. The default value is Nothing. (Inherited from FlexObject)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from FlexObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TextObject)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
volume	the volume of the control.
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TextObject)

Name	Description
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)

Name	Description
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>Move</i>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <i>FlexObject</i>)
<i>MuteChange</i>	Toggles the muting of the control.
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>SetFocus</i>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <i>FlexObject</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>ToString</i>	Returns a string representation of the control. (Inherited from <i>FlexDisplayObject</i>)
<i>Type</i>	Dispatched when the user presses a key. (Inherited from <i>SparkButtonBase</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional

Name	Description
WaitForDisappearance	<p>timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)</p> <p>Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)</p>
WaitForObject	<p>Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code>. Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code>, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)</p>
WaitForProperty	<p>Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)</p>
WaitForPropertyNotEquals	<p>Waits until the specified property has a value that is different to the specified value or until the timeout is reached. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)</p>

SparkNavigatorContent Class

Description

The `NavigatorContent` class defines a Spark container that can be used in an MX navigator container, such as the `ViewStack`, `TabNavigator` and `Accordion` containers.

Inheritance Hierarchy

- [SparkSkinnableContainer](#)
 - `SparkNavigatorContent`

Syntax

```
'Declaration  
Public Class SparkNavigatorContent _  
Inherits SparkSkinnableContainer
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
autoLayout	whether measurement and layout are done when the position or size of a child is changed. (Inherited from SparkSkinnableContainer)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
columnNames	a list containing the names of all columns in the data. (Inherited from SparkSkinnableContainerBase)
creationPolicy	the content creation policy for this component. (Inherited from SparkSkinnableContainer)
currentState	the current view state of the component. (Inherited from FlexObject)
deferredContentCreated	whether deferred content has been created. (Inherited from SparkSkinnableContainer)
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from FlexObject)
firstVisibleRow	the index of the first visible child. (Inherited from SparkSkinnableContainerBase)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from FlexObject)
height	the height of the display object, in pixels. (Inherited from FlexDisplayObject)
id	the ID of the component. (Inherited from FlexObject)
lastVisibleRow	the index of the last visible child. (Inherited from SparkSkinnableContainerBase)

Name	Description
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>numElements</i>	The number of visual elements in this container. (Inherited from <i>SparkSkinnableContainer</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)

Name	Description
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from SparkSkinnableContainerBase)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from SparkSkinnableContainerBase)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from SparkSkinnableContainerBase)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
GetParent	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
GetProperty	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <i>FlexDisplayObject</i>)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from <i>SparkSkinnableContainerBase</i>)
HighlightObject	Highlights this object. (Inherited from <i>TestObject</i>)
ImageClick	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
ImageClickFile	Clicks on the specified image. (Inherited from <i>TestObject</i>)
ImageExists	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
ImageExistsFile	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
Invoke	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
InvokeMethods	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <i>FlexObject</i>)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)

Name	Description
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkNumericStepper Class

Description

The NumericStepper control lets you select a number from an ordered set. The NumericStepper provides the same functionality as the Spinner component, but adds a TextInput control so that you can directly edit the value of the component, rather than modifying it by using the control's arrow buttons.

Inheritance Hierarchy

- [SparkSpinner](#)
 - SparkNumericStepper

Syntax

```
'Declaration
Public Class SparkNumericStepper _
Inherits SparkSpinner
```

Properties

Name	Description
allowValueWrap	the behavior of the control for a step when the current value is either the maximum or minimum value. (Inherited from SparkSpinner)
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)

Name	Description
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>enableIME</i>	a value whether the IME should be enabled when the component receives focus.
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>imeMode</i>	the IME (Input Method Editor) mode.
<i>maxChars</i>	The maximum number of characters that can be entered in the field.
<i>maximum</i>	The maximum valid value. (Inherited from <i>SparkRange</i>)
<i>minimum</i>	The minimum valid value. (Inherited from <i>SparkRange</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)

Name	Description
scaleY	the number that specifies the vertical scaling factor. (Inherited from FlexObject)
snapInterval	the snapInterval. (Inherited from SparkRange)
stepSize	The amount that the value property changes when the <code>changeValueByStep()</code> method is called. (Inherited from SparkRange)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from FlexDisplayObject)
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TestObject)
themeColor	the theme color of a component. (Inherited from FlexObject)
toolTip	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from FlexObject)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <code>useHandCursor</code> is false, the arrow pointer is used instead. (Inherited from FlexObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
value	The current value for this range. (Inherited from SparkRange)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from FlexDisplayObject)
y	the y coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant

Name	Description
	<i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
Change	Dispatched when the value of the NumericStepper changes as a result of user interaction. (Inherited from SparkSpinner)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)

Name	Description
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Input</i>	Dispatched when the user types, deletes, or pastes text into the control.
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>Move</i>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <i>FlexObject</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>SelectText</i>	Dispatched when text is selected.
<i>SetFocus</i>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <i>FlexObject</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>ToString</i>	Returns a string representation of the control. (Inherited from <i>FlexDisplayObject</i>)

Name	Description
Type	Dispatched when the user presses a key. (Inherited from SparkSpinner)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option OPT_WAIT_RESOLVE_OBJDEF. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkObject Class

Description

The SparkObject class defines the base class for all spark components.

Inheritance Hierarchy

- [FlexObject](#)
 - SparkObject
 - [SparkButtonBase](#)
 - [SparkImage](#)
 - [SparkRange](#)
 - [SparkRichEditableText](#)
 - [SparkSkinnableContainerBase](#)
 - [SparkSkinnableTextBase](#)
 - [SparkVideoPlayer](#)

Syntax

```
'Declaration  
Public Class SparkObject _  
Inherits FlexObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
currentState	the current view state of the component. (Inherited from FlexObject)
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from FlexObject)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from FlexObject)
height	the height of the display object, in pixels. (Inherited from FlexDisplayObject)
id	the ID of the component. (Inherited from FlexObject)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that

Name	Description
	is on the display list receives mouse events. If <code>mouseEnabled</code> is set to <code>false</code> , the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the <code>mouseEnabled</code> behavior for all children of an object on the display list, use <code>flash.display.DisplayObjectContainer.mouseChildren</code> . (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the <code>width</code> or <code>explicitWidth</code> properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is <code>true</code> . (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is <code>true</code> . If <code>useHandCursor</code> is <code>false</code> , the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)

Name	Description
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)

Name	Description
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkPanel Class

Description

The `Panel` class defines a container that includes a title bar, a caption, a border, and a content area for its children.

Inheritance Hierarchy

- *SparkSkinnableContainer*
 - SparkPanel
 - *SparkTitleWindow*

Syntax

```
'Declaration
Public Class SparkPanel _
Inherits SparkSkinnableContainer
```

Properties

Name	Description
<i>alpha</i>	the alpha transparency value of the object specified. (Inherited from <i>FlexDisplayObject</i>)
<i>autoLayout</i>	whether measurement and layout are done when the position or size of a child is changed. (Inherited from <i>SparkSkinnableContainer</i>)
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i>)
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>controlBarVisible</i>	a value whether the control bar is visible.
<i>creationPolicy</i>	the content creation policy for this component. (Inherited from <i>SparkSkinnableContainer</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>deferredContentCreated</i>	whether deferred content has been created. (Inherited from <i>SparkSkinnableContainer</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>SparkSkinnableContainerBase</i>)

Name	Description
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>numElements</i>	The number of visual elements in this container. (Inherited from <i>SparkSkinnableContainer</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>title</i>	the title or caption displayed in the title bar.

Name	Description
<code>tooltip</code>	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from <code>FlexObject</code>)
<code>useHandCursor</code>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <code>useHandCursor</code> is false, the arrow pointer is used instead. (Inherited from <code>FlexObject</code>)
<code>Value</code>	The value of the control, e.g.: text in a text control. (Inherited from <code>TestObject</code>)
<code>visible</code>	whether the display object is visible. (Inherited from <code>FlexDisplayObject</code>)
<code>width</code>	the width of the display object, in pixels. (Inherited from <code>FlexDisplayObject</code>)
<code>x</code>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <code>FlexDisplayObject</code>)
<code>y</code>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <code>FlexDisplayObject</code>)

Methods

Name	Description
<code>CaptureBitmap</code>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <code>TestObject</code>)
<code>ChangeFocus</code>	Changes the current focus. (Inherited from <code>FlexObject</code>)
<code>Click</code>	Clicks on the object. (Inherited from <code>IClickable</code>)
<code>DoubleClick</code>	Double-clicks a mouse button on the object. (Inherited from <code>IClickable</code>)
<code>DragCancel</code>	Dispatched when a drag operation is cancelled. (Inherited from <code>SparkSkinnableContainerBase</code>)
<code>DragDrop</code>	Dispatched when the dragged item is dropped. (Inherited from <code>SparkSkinnableContainerBase</code>)
<code>DragStart</code>	Dispatched when the drag/drop operation begins. (Inherited from <code>SparkSkinnableContainerBase</code>)
<code>Exists</code>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <code>TestObject</code>)

Name	Description
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>GetStyle</i>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <i>FlexDisplayObject</i>)
<i>GetValues</i>	Returns a matrix containing the automation values of all parts of the components. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)

Name	Description
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkPopUpAnchor Class

Description

Identifies a Spark PopUpAnchor control.

Inheritance Hierarchy

- [FlexObject](#)
 - SparkPopUpAnchor

Syntax

```
'Declaration
Public Class SparkPopUpAnchor _
Inherits FlexObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
currentState	the current view state of the component. (Inherited from FlexObject)
displayPopUp	whether the popUp is visible.
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from FlexObject)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from FlexObject)
height	the height of the display object, in pixels. (Inherited from FlexDisplayObject)
id	the ID of the component. (Inherited from FlexObject)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use <code>flash.display.DisplayObjectContainer.mouseChildren</code> . (Inherited from FlexDisplayObject)
numAutomationChildren	the number of automation children this container has. (Inherited from FlexObject)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from FlexObject)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from FlexObject)
popUpHeightMatchesAnchorHeight	whether the height of the popUp control is set to the value of the PopUpAnchor's height.

Name	Description
<i>popUpPosition</i>	the position of the popUp control when it is opened, relative to the PopUpAnchor component.
<i>popUpWidthMatchesAnchorWidth</i>	whether the width of the popUp control is set to the value of the PopUpAnchor's width.
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TextObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TextObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/ Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant

Name	Description
	<i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject . (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)

Name	Description
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
WaitForDisappearance	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject) Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkRadioButton Class

Description

The `RadioButton` component allows the user make a single choice within a set of mutually exclusive choices. A `RadioButtonGroup` is composed of two or more `RadioButton` components with the same `groupName` property.

Inheritance Hierarchy

- [SparkToggleButtonBase](#)
 - `SparkRadioButton`

Syntax

```
'Declaration
Public Class SparkRadioButton _
Inherits SparkToggleButtonBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
autoRepeat	whether to dispatch repeated buttonDown events if the user holds down the mouse button. (Inherited from SparkButtonBase)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
currentState	the current view state of the component. (Inherited from FlexObject)
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from FlexObject)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from FlexObject)
groupName	the name of the group to which this RadioButton component belongs, or specifies the value of the id property of a RadioButtonGroup component if this RadioButton is part of a group defined by a RadioButtonGroup component.
height	the height of the display object, in pixels. (Inherited from FlexDisplayObject)
id	the ID of the component. (Inherited from FlexObject)
label	the text to appear on the ButtonBase control. (Inherited from SparkButtonBase)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list,

Name	Description
	use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or <i>explicitWidth</i> properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selected</i>	whether the button is in the down state, and false if it is in the up state. (Inherited from <i>SparkToggleButtonBase</i>)
<i>stickyHighlighting</i>	a value whether the button displays its down skin when the user presses it but changes to its over skin when the user drags the mouse off of it. (Inherited from <i>SparkButtonBase</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is <i>Nothing</i> . (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <i>useHandCursor</i> is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Name	Description
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant System.Drawing.Imaging.PixelFormat.Format32bppRgb can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	The event triggered when a drag operation is cancelled.
DragDrop	The event triggered when the dragged item is dropped.
DragStart	The event triggered when the drag/drop operation begins.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)

Name	Description
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)

Name	Description
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key. (Inherited from SparkButtonBase)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkRange Class

Description

The Range class holds a value and an allowed range for that value, defined by minimum and maximum properties.

Inheritance Hierarchy

- [SparkObject](#)
 - SparkRange
 - [SparkSpinner](#)
 - [SparkTrackBase](#)

Syntax

```
'Declaration
Public Class SparkRange _
Inherits SparkObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
currentState	the current view state of the component. (Inherited from FlexObject)
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)

Name	Description
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>maximum</i>	The maximum valid value.
<i>minimum</i>	The minimum valid value.
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>snapInterval</i>	the snapInterval.
<i>stepSize</i>	The amount that the value property changes when the changeValueByStep() method is called.
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)

Name	Description
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <i>useHandCursor</i> is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>value</i>	The current value for this range.
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>ChangeFocus</i>	Changes the current focus. (Inherited from <i>FlexObject</i>)
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i>)
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i>)
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)

Name	Description
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)

Name	Description
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkRichEditableText Class

Description

RichEditableText is a low-level UIComponent for displaying, scrolling, selecting, and editing richly-formatted text.

Inheritance Hierarchy

- [SparkObject](#)
 - SparkRichEditableText

Syntax

```
'Declaration
Public Class SparkRichEditableText _
Inherits SparkObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
clipAndEnableScrolling	whether to clip the children to the boundaries of the viewport.
columnNames	a list containing the names of all columns in the data.
contentHeight	The height of the text.

Name	Description
<code>contentWidth</code>	The width of the text.
<code>currentState</code>	the current view state of the component. (Inherited from FlexObject)
<code>displayAsPassword</code>	whether the text field is a password text field.
<code>editable</code>	A flag indicating whether the user is allowed to edit the text in this control.
<code>enabled</code>	whether the component can accept user interaction. (Inherited from FlexObject)
<code>enableIME</code>	A flag that indicates whether the IME should be enabled when the component receives focus.
<code>errorColor</code>	the color of the component highlight when validation fails. (Inherited from FlexObject)
<code>errorString</code>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from FlexObject)
<code>firstVisibleRow</code>	the index of the first visible child.
<code>focusEnabled</code>	whether the component can receive focus when tabbed to. (Inherited from FlexObject)
<code>height</code>	the height of the display object, in pixels. (Inherited from FlexDisplayObject)
<code>heightInLines</code>	The default height of the control, measured in lines.
<code>horizontalScrollPosition</code>	The number of pixels by which the text is scrolled horizontally.
<code>id</code>	the ID of the component. (Inherited from FlexObject)
<code>imeMode</code>	the IME (input method editor) mode.
<code>lastVisibleRow</code>	the index of the last visible child.
<code>maxChars</code>	The maximum number of characters that the text field can contain, as entered by a user.
<code>mouseEnabled</code>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use <code>flash.display.DisplayObjectContainer.mouseChildren</code> . (Inherited from FlexDisplayObject)
<code>multiline</code>	whether the user can enter multiline text.
<code>numAutomationChildren</code>	the number of automation children this container has. (Inherited from FlexObject)
<code>numColumns</code>	the total number of columns in the data available.
<code>numRows</code>	the total number of rows of data available.

Name	Description
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>restrict</i>	the set of characters that a user can enter into the text field.
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectable</i>	A flag indicating whether the content is selectable with the mouse, or with the keyboard when the control has the keyboard focus.
<i>selectionActivePosition</i>	A character position, relative to the beginning of the text String, specifying the end of the selection that moves when the selection is extended with the arrow keys.
<i>selectionAnchorPosition</i>	A character position, relative to the beginning of the text String, specifying the end of the selection that stays fixed when the selection is extended with the arrow keys.
<i>selectionHighlighting</i>	a value whether the text selection is highlighted.
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TextObject</i>)
<i>text</i>	The text String displayed by this component.
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TextObject</i>)
<i>verticalScrollPosition</i>	The number of pixels by which the text is scrolled vertically.
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>widthInChars</i>	The default width of the control, measured in em units.

Name	Description
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	The event triggered when a drag operation is cancelled.
DragDrop	The event triggered when the dragged item is dropped.
DragStart	The event triggered when the drag/drop operation begins.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)

Name	Description
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components.
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Input	Dispatched when the user types, deletes, or pastes text into the control.
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MouseScroll	Dispatched when the mouse is used to move the scroll bars on this container.
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SelectText	Dispatched when text is selected.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider

Name	Description
WaitForObject	increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkRichText Class

Description

RichText is a low-level UIComponent that can display one or more lines of richly-formatted text and embedded images.

Inheritance Hierarchy

- [SparkTextBase](#)
 - SparkRichText

Syntax

```
'Declaration
Public Class SparkRichText _
Inherits SparkTextBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)

Name	Description
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>isTruncated</i>	whether the text has been truncated. (Inherited from <i>SparkTextBase</i>)
<i>luminosityClip</i>	whether the luminosity mask clips the masked content.
<i>luminosityInvert</i>	whether the calculation of the RGB color value of a graphic element is masked by a luminosity mask.
<i>maskType</i>	how the mask is applied to the component. The possible values are <i>MaskType.CLIP</i> , <i>MaskType.ALPHA</i> and <i>MaskType.LUMINOSITY</i> . Clip Masking When masking in clip mode, a clipping masks is reduced to 1-bit.
<i>maxDisplayedLines</i>	An integer which determines whether, and where, the text gets truncated. (Inherited from <i>SparkTextBase</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any <i>InteractiveObject</i> instance that is on the display list receives mouse events. If <i>mouseEnabled</i> is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the <i>mouseEnabled</i> behavior for all children of an object on the display list, use <i>flash.display.DisplayObjectContainer.mouseChildren</i> . (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or <i>explicitWidth</i> properties resets this property to NaN. (Inherited from <i>FlexObject</i>)

Name	Description
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>text</i>	The text displayed by this text component. (Inherited from <i>SparkTextBase</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is <i>Nothing</i> . (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <i>useHandCursor</i> is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the <i>DisplayObject</i> instance relative to the local coordinates of the parent <i>DisplayObjectContainer</i> . (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the <i>DisplayObject</i> instance relative to the local coordinates of the parent <i>DisplayObjectContainer</i> . (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <i>TestObject</i>)

Name	Description
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	The event triggered when a drag operation is cancelled. (Inherited from SparkTextBase)
DragDrop	The event triggered when the dragged item is dropped. (Inherited from SparkTextBase)
DragStart	The event triggered when the drag/drop operation begins. (Inherited from SparkTextBase)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)

Name	Description
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject . (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key. (Inherited from SparkTextBase)

Name	Description
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkScrollBar Class

Description

The `ScrollBarBase` class helps to position the portion of data that is displayed when there is too much data to fit in a display area.

Inheritance Hierarchy

- [SparkTrackBase](#)
 - SparkScrollBar

Syntax

```
'Declaration
Public Class SparkScrollBar _
Inherits SparkTrackBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
currentState	the current view state of the component. (Inherited from FlexObject)
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from FlexObject)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from FlexObject)
height	the height of the display object, in pixels. (Inherited from FlexDisplayObject)
id	the ID of the component. (Inherited from FlexObject)
maximum	The maximum valid value. (Inherited from SparkRange)
minimum	The minimum valid value. (Inherited from SparkRange)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use <code>flash.display.DisplayObjectContainer.mouseChildren</code> . (Inherited from FlexDisplayObject)

Name	Description
numAutomationChildren	the number of automation children this container has. (Inherited from FlexObject)
pageSize	The change in the value of the value property when you call the changeValueByPage() method.
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from FlexObject)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from FlexObject)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from FlexObject)
scaleY	the number that specifies the vertical scaling factor. (Inherited from FlexObject)
snapInterval	the snapInterval . (Inherited from SparkRange)
stepSize	The amount that the value property changes when the changeValueByStep() method is called. (Inherited from SparkRange)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from FlexDisplayObject)
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TestObject)
themeColor	the theme color of a component. (Inherited from FlexObject)
toolTip	the text to display in the ToolTip. The default value is Nothing . (Inherited from FlexObject)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from FlexObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
value	The current value for this range. (Inherited from SparkRange)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer . (Inherited from FlexDisplayObject)

Name	Description
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Change	Dispatched when the value of the NumericStepper changes as a result of user interaction. (Inherited from SparkTrackBase)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)

Name	Description
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key. (Inherited from SparkTrackBase)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If

Name	Description
	you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkSkinnableContainer Class

Description

The SparkSkinnableContainer class is the base class for skinnable containers that have visual content.

Inheritance Hierarchy

- [SparkSkinnableContainerBase](#)
 - SparkSkinnableContainer
 - [SparkApplication](#)
 - [SparkBorderContainer](#)
 - [SparkForm](#)
 - [SparkFormItem](#)
 - [SparkNavigatorContent](#)
 - [SparkPanel](#)
 - [SparkSkinnablePopUpContainer](#)
 - [SparkWindow](#)

Syntax

```
'Declaration
Public Class SparkSkinnableContainer _
Inherits SparkSkinnableContainerBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
autoLayout	whether measurement and layout are done when the position or size of a child is changed.
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
columnNames	a list containing the names of all columns in the data. (Inherited from SparkSkinnableContainerBase)

Name	Description
<i>creationPolicy</i>	the content creation policy for this component.
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>deferredContentCreated</i>	whether deferred content has been created.
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>numElements</i>	The number of visual elements in this container.
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)

Name	Description
scaleY	the number that specifies the vertical scaling factor. (Inherited from FlexObject)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from FlexDisplayObject)
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TestObject)
themeColor	the theme color of a component. (Inherited from FlexObject)
toolTip	the text to display in the ToolTip. The default value is Nothing. (Inherited from FlexObject)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from FlexObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)

Name	Description
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from SparkSkinnableContainerBase)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from SparkSkinnableContainerBase)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from SparkSkinnableContainerBase)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from SparkSkinnableContainerBase)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)

Name	Description
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>Move</i>	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <i>FlexObject</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>SetFocus</i>	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from <i>FlexObject</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>ToString</i>	Returns a string representation of the control. (Inherited from <i>FlexDisplayObject</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)

Name	Description
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkSkinnableContainerBase Class

Description

Base class for spark container components.

Inheritance Hierarchy

- [SparkObject](#)
 - SparkSkinnableContainerBase

- [SparkDataGrid](#)
- [SparkSkinnableContainer](#)
- [SparkSkinnableDataContainer](#)

Syntax

```
'Declaration
Public Class SparkSkinnableContainerBase _
Inherits SparkObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
columnNames	a list containing the names of all columns in the data.
currentState	the current view state of the component. (Inherited from FlexObject)
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from FlexObject)
firstVisibleRow	the index of the first visible child.
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from FlexObject)
height	the height of the display object, in pixels. (Inherited from FlexDisplayObject)
id	the ID of the component. (Inherited from FlexObject)
lastVisibleRow	the index of the last visible child.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list,

Name	Description
	use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available.
<i>numRows</i>	the total number of rows of data available.
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Dispatched when a drag operation is cancelled.
DragDrop	Dispatched when the dragged item is dropped.
DragStart	Dispatched when the drag/drop operation begins.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject . (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)

Name	Description
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components.
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)

Name	Description
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkSkinnableDataContainer Class

Description

The SkinnableDataContainer class is the base container class for data items.

Inheritance Hierarchy

- [SparkSkinnableContainerBase](#)
 - SparkSkinnableDataContainer
 - [SparkListBase](#)

Syntax

```
'Declaration  
Public Class SparkSkinnableDataContainer _  
Inherits SparkSkinnableContainerBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
autoLayout	the measurement and layout are done when the position or size of a child is changed.
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
columnNames	a list containing the names of all columns in the data. (Inherited from SparkSkinnableContainerBase)
currentState	the current view state of the component. (Inherited from FlexObject)
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from FlexObject)
firstVisibleRow	the index of the first visible child. (Inherited from SparkSkinnableContainerBase)

Name	Description
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)

Name	Description
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <i>useHandCursor</i> is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the <i>DisplayObject</i> instance relative to the local coordinates of the parent <i>DisplayObjectContainer</i> . (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the <i>DisplayObject</i> instance relative to the local coordinates of the parent <i>DisplayObjectContainer</i> . (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>ChangeFocus</i>	Changes the current focus. (Inherited from <i>FlexObject</i>)
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i>)
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i>)
<i>DragCancel</i>	Dispatched when a drag operation is cancelled. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>DragDrop</i>	Dispatched when the dragged item is dropped. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>DragStart</i>	Dispatched when the drag/drop operation begins. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)

Name	Description
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from SparkSkinnableContainerBase)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)

Name	Description
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by

Name	Description
	setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkSkinnablePopUpContainer Class

Description

Identifies a `SparkSkinnablePopUpContainer` control.

Inheritance Hierarchy

- [SparkSkinnableContainer](#)
 - `SparkSkinnablePopUpContainer`

Syntax

```
'Declaration
Public Class SparkSkinnablePopUpContainer _
Inherits SparkSkinnableContainer
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)

Name	Description
<i>autoLayout</i>	whether measurement and layout are done when the position or size of a child is changed. (Inherited from <i>SparkSkinnableContainer</i>)
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i>)
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>creationPolicy</i>	the content creation policy for this component. (Inherited from <i>SparkSkinnableContainer</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>deferredContentCreated</i>	whether deferred content has been created. (Inherited from <i>SparkSkinnableContainer</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>isOpen</i>	whether the container is open.
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any <i>InteractiveObject</i> instance that is on the display list receives mouse events. If <i>mouseEnabled</i> is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the <i>mouseEnabled</i> behavior for all children of an object on the display list,

Name	Description
	use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>numElements</i>	The number of visual elements in this container. (Inherited from <i>SparkSkinnableContainer</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Name	Description
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant System.Drawing.Imaging.PixelFormat.Format32bppRgb can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from SparkSkinnableContainerBase)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from SparkSkinnableContainerBase)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from SparkSkinnableContainerBase)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)

Name	Description
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from SparkSkinnableContainerBase)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)

Name	Description
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout

Name	Description
	specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkSkinnableTextBase Class

Description

The base class for skinnable components, such as the Spark TextInput and TextArea, that include an instance of RichEditableText in their skin to provide rich text display, scrolling, selection, and editing.

Inheritance Hierarchy

- [SparkObject](#)
 - SparkSkinnableTextBase
 - [SparkTextArea](#)
 - [SparkTextInput](#)

Syntax

```
'Declaration
Public Class SparkSkinnableTextBase _
Inherits SparkObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
columnNames	a list containing the names of all columns in the data.
currentState	the current view state of the component. (Inherited from FlexObject)
displayAsPassword	whether the text field is a password text field.

Name	Description
<i>editable</i>	A flag indicating whether the user is allowed to edit the text in this control.
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>enableIME</i>	A flag that indicates whether the IME should be enabled when the component receives focus.
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child.
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>imeMode</i>	the IME (input method editor) mode.
<i>lastVisibleRow</i>	the index of the last visible child.
<i>maxChars</i>	The maximum number of characters that the text field can contain, as entered by a user.
<i>maxWidth</i>	The maximum recommended width of the component to be considered by the parent during layout.
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available.
<i>numRows</i>	the total number of rows of data available.
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>restrict</i>	the set of characters that a user can enter into the text field.

Name	Description
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectable</i>	A flag indicating whether the content is selectable with the mouse, or with the keyboard when the control has the keyboard focus.
<i>selectionActivePosition</i>	A character position, relative to the beginning of the text String, specifying the end of the selection that moves when the selection is extended with the arrow keys.
<i>selectionAnchorPosition</i>	A character position, relative to the beginning of the text String, specifying the end of the selection that stays fixed when the selection is extended with the arrow keys.
<i>selectionHighlighting</i>	a value whether the text selection is highlighted.
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>text</i>	The text String displayed by this component.
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is <i>Nothing</i> . (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <i>useHandCursor</i> is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the <i>DisplayObject</i> instance relative to the local coordinates of the parent <i>DisplayObjectContainer</i> . (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the <i>DisplayObject</i> instance relative to the local coordinates of the parent <i>DisplayObjectContainer</i> . (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject . (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)

Name	Description
GetValues	Returns a matrix containing the automation values of all parts of the components.
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Input	Dispatched when the user types, deletes, or pastes text into the control.
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MouseScroll	Dispatched when the mouse is used to move the scroll bars on this container.
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SelectText	Dispatched when text is selected.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)

Name	Description
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout

Name	Description
	parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkSlider Class

Description

Lets users select a value by moving a slider thumb between the end points of the slider track.

Inheritance Hierarchy

- [SparkTrackBase](#)
 - SparkSlider
 - [SparkVolumeBar](#)

Syntax

```
'Declaration
Public Class SparkSlider _
Inherits SparkTrackBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
currentState	the current view state of the component. (Inherited from FlexObject)
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from FlexObject)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from FlexObject)

Name	Description
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>maximum</i>	The maximum valid value. (Inherited from <i>SparkRange</i>)
<i>minimum</i>	The minimum valid value. (Inherited from <i>SparkRange</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>snapInterval</i>	the snapInterval. (Inherited from <i>SparkRange</i>)
<i>stepSize</i>	The amount that the value property changes when the changeValueByStep() method is called. (Inherited from <i>SparkRange</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)

Name	Description
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
value	The current value for this range. (Inherited from SparkRange)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Change	Dispatched when the value of the NumericStepper changes as a result of user interaction. (Inherited from SparkTrackBase)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)

An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkSpinner Class

Description

A Spinner component selects a value from an ordered set. It uses two buttons that increase or decrease the current value based on the current value of the stepSize property.

Inheritance Hierarchy

- [SparkRange](#)
 - SparkSpinner
 - [SparkNumericStepper](#)

Syntax

```
'Declaration
Public Class SparkSpinner _
Inherits SparkRange
```

Properties

Name	Description
allowValueWrap	the behavior of the control for a step when the current value is either the maximum or minimum value.
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)

Name	Description
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>maximum</i>	The maximum valid value. (Inherited from <i>SparkRange</i>)
<i>minimum</i>	The minimum valid value. (Inherited from <i>SparkRange</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>snapInterval</i>	the snapInterval. (Inherited from <i>SparkRange</i>)
<i>stepSize</i>	The amount that the value property changes when the changeValueByStep() method is called. (Inherited from <i>SparkRange</i>)

Name	Description
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from FlexDisplayObject)
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TestObject)
themeColor	the theme color of a component. (Inherited from FlexObject)
toolTip	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from FlexObject)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <code>useHandCursor</code> is false, the arrow pointer is used instead. (Inherited from FlexObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
value	The current value for this range. (Inherited from SparkRange)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from FlexDisplayObject)
y	the y coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Change	Dispatched when the value of the <code>NumericStepper</code> changes as a result of user interaction.
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)

Name	Description
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)

GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)

Name	Description
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout

Name	Description
WaitForObject	parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject) Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option OPT_WAIT_RESOLVE_OBJDEF. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkTabBar Class

Description

The TabBar class displays a set of identical tabs. One tab can be selected at a time, and the first tab is selected by default.

Inheritance Hierarchy

- [SparkListBase](#)
 - SparkTabBar

Syntax

```
'Declaration
Public Class SparkTabBar _
Inherits SparkListBase
```

Properties

Name	Description
<i>alpha</i>	the alpha transparency value of the object specified. (Inherited from <i>FlexDisplayObject</i>)
<i>autoLayout</i>	the measurement and layout are done when the position or size of a child is changed. (Inherited from <i>SparkSkinnableDataContainer</i>)
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i>)
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>caretIndex</i>	The item that is currently in focus. (Inherited from <i>SparkListBase</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>labelField</i>	The name of the field in the data provider items to display as the label. (Inherited from <i>SparkListBase</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list,

Name	Description
	use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>requireSelection</i>	a value if a data item must always be selected in the control (Inherited from <i>SparkListBase</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectedIndex</i>	The 0-based index of the selected item, or -1 if no item is selected. (Inherited from <i>SparkListBase</i>)
<i>selectedItem</i>	The item that is currently selected. (Inherited from <i>SparkListBase</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>useVirtualLayout</i>	the value of the useVirtualLayout property of the layout associated with this control. (Inherited from <i>SparkListBase</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)

Name	Description
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from SparkSkinnableContainerBase)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from SparkSkinnableContainerBase)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from SparkSkinnableContainerBase)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)

Name	Description
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetItemCount	Gets the number of items in the ComboBox. (Inherited from SparkListBase)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from SparkSkinnableContainerBase)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)

Name	Description
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Select	Dispatched when an item in the list is selected. (Inherited from SparkListBase)
SelectIndex	Dispatched when the user clicks on an item in the list or navigates to the item using a keyboard.
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key. (Inherited from SparkListBase)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown.

Name	Description
	The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkTextArea Class

Description

TextArea is a text-entry control that lets users enter and edit multiple lines of richly formatted text. It can display horizontal and vertical scrollbars for scrolling through the text and supports vertical scrolling with the mouse wheel.

Inheritance Hierarchy

- [SparkSkinnableTextBase](#)
 - SparkTextArea

Syntax

```
'Declaration
Public Class SparkTextArea _
Inherits SparkSkinnableTextBase
```

Properties

Name	Description
<i>alpha</i>	the alpha transparency value of the object specified. (Inherited from <i>FlexDisplayObject</i>)
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i>)
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>SparkSkinnableTextBase</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>displayAsPassword</i>	whether the text field is a password text field. (Inherited from <i>SparkSkinnableTextBase</i>)
<i>editable</i>	A flag indicating whether the user is allowed to edit the text in this control. (Inherited from <i>SparkSkinnableTextBase</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>enableIME</i>	A flag that indicates whether the IME should be enabled when the component receives focus. (Inherited from <i>SparkSkinnableTextBase</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>SparkSkinnableTextBase</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>heightInLines</i>	The default height of the control, measured in lines.
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>imeMode</i>	the IME (input method editor) mode. (Inherited from <i>SparkSkinnableTextBase</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>SparkSkinnableTextBase</i>)

Name	Description
<i>maxChars</i>	The maximum number of characters that the text field can contain, as entered by a user. (Inherited from <i>SparkSkinnableTextBase</i>)
<i>maxWidth</i>	The maximum recommended width of the component to be considered by the parent during layout. (Inherited from <i>SparkSkinnableTextBase</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>SparkSkinnableTextBase</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>SparkSkinnableTextBase</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>restrict</i>	the set of characters that a user can enter into the text field. (Inherited from <i>SparkSkinnableTextBase</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectable</i>	A flag indicating whether the content is selectable with the mouse, or with the keyboard when the control has the keyboard focus. (Inherited from <i>SparkSkinnableTextBase</i>)
<i>selectionActivePosition</i>	A character position, relative to the beginning of the text String, specifying the end of the selection that moves when the selection is extended with the arrow keys. (Inherited from <i>SparkSkinnableTextBase</i>)
<i>selectionAnchorPosition</i>	A character position, relative to the beginning of the text String, specifying the end of the selection that stays fixed when the selection is extended with the arrow keys. (Inherited from <i>SparkSkinnableTextBase</i>)
<i>selectionHighlighting</i>	a value whether the text selection is highlighted. (Inherited from <i>SparkSkinnableTextBase</i>)

Name	Description
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from FlexDisplayObject)
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TestObject)
text	The text String displayed by this component. (Inherited from SparkSkinnableTextBase)
themeColor	the theme color of a component. (Inherited from FlexObject)
toolTip	the text to display in the ToolTip. The default value is Nothing. (Inherited from FlexObject)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from FlexObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
widthInChars	The default width of the control, measured in em units.
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)

Name	Description
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	The event triggered when a drag operation is cancelled.
DragDrop	The event triggered when the dragged item is dropped.
DragStart	The event triggered when the drag/drop operation begins.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from SparkSkinnableTextBase)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)

Name	Description
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Input	Dispatched when the user types, deletes, or pastes text into the control. (Inherited from SparkSkinnableTextBase)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MouseScroll	Dispatched when the mouse is used to move the scroll bars on this container. (Inherited from SparkSkinnableTextBase)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SelectText	Dispatched when text is selected. (Inherited from SparkSkinnableTextBase)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)

Name	Description
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key. (Inherited from SparkSkinnableTextBase)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkTextBase Class

Description

The base class for Spark text controls such as Label and RichText which display text using CSS styles for the default format.

Inheritance Hierarchy

- *FlexObject*
 - SparkTextBase
 - *SparkLabel*
 - *SparkRichText*

Syntax

```
'Declaration  
Public Class SparkTextBase _  
Inherits FlexObject
```

Properties

Name	Description
<i>alpha</i>	the alpha transparency value of the object specified. (Inherited from <i>FlexDisplayObject</i>)
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i>)
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)

Name	Description
<i>isTruncated</i>	whether the text has been truncated.
<i>maxDisplayedLines</i>	An integer which determines whether, and where, the text gets truncated.
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>text</i>	The text displayed by this text component.
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)

Name	Description
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	The event triggered when a drag operation is cancelled.
DragDrop	The event triggered when the dragged item is dropped.
DragStart	The event triggered when the drag/drop operation begins.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)

Name	Description
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)

Name	Description
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly

Name	Description
	pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkTextInput Class

Description

TextInput is a text-entry control that lets users enter and edit a single line of uniformly-formatted text.

Inheritance Hierarchy

- [SparkSkinnableTextBase](#)
 - SparkTextInput

Syntax

```
'Declaration
Public Class SparkTextInput _
Inherits SparkSkinnableTextBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
columnNames	a list containing the names of all columns in the data. (Inherited from SparkSkinnableTextBase)
currentState	the current view state of the component. (Inherited from FlexObject)
displayAsPassword	whether the text field is a password text field. (Inherited from SparkSkinnableTextBase)

Name	Description
editable	A flag indicating whether the user is allowed to edit the text in this control. (Inherited from SparkSkinnableTextBase)
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
enableIME	A flag that indicates whether the IME should be enabled when the component receives focus. (Inherited from SparkSkinnableTextBase)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from FlexObject)
firstVisibleRow	the index of the first visible child. (Inherited from SparkSkinnableTextBase)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from FlexObject)
height	the height of the display object, in pixels. (Inherited from FlexDisplayObject)
id	the ID of the component. (Inherited from FlexObject)
imeMode	the IME (input method editor) mode. (Inherited from SparkSkinnableTextBase)
lastVisibleRow	the index of the last visible child. (Inherited from SparkSkinnableTextBase)
maxChars	The maximum number of characters that the text field can contain, as entered by a user. (Inherited from SparkSkinnableTextBase)
maxWidth	The maximum recommended width of the component to be considered by the parent during layout. (Inherited from SparkSkinnableTextBase)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from FlexDisplayObject)
numAutomationChildren	the number of automation children this container has. (Inherited from FlexObject)
numColumns	the total number of columns in the data available. (Inherited from SparkSkinnableTextBase)
numRows	the total number of rows of data available. (Inherited from SparkSkinnableTextBase)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from FlexObject)

Name	Description
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>restrict</i>	the set of characters that a user can enter into the text field. (Inherited from <i>SparkSkinnableTextBase</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selectable</i>	A flag indicating whether the content is selectable with the mouse, or with the keyboard when the control has the keyboard focus. (Inherited from <i>SparkSkinnableTextBase</i>)
<i>selectionActivePosition</i>	A character position, relative to the beginning of the text String, specifying the end of the selection that moves when the selection is extended with the arrow keys. (Inherited from <i>SparkSkinnableTextBase</i>)
<i>selectionAnchorPosition</i>	A character position, relative to the beginning of the text String, specifying the end of the selection that stays fixed when the selection is extended with the arrow keys. (Inherited from <i>SparkSkinnableTextBase</i>)
<i>selectionHighlighting</i>	a value whether the text selection is highlighted. (Inherited from <i>SparkSkinnableTextBase</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>text</i>	The text String displayed by this component. (Inherited from <i>SparkSkinnableTextBase</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)

Name	Description
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
widthInChars	The default width of the control, measured in em units.
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	The event triggered when a drag operation is cancelled.
DragDrop	The event triggered when the dragged item is dropped.
DragStart	The event triggered when the drag/drop operation begins.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
GetParent	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
GetProperty	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <i>FlexDisplayObject</i>)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from <i>SparkSkinnableTextBase</i>)
HighlightObject	Highlights this object. (Inherited from <i>TestObject</i>)
ImageClick	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
ImageClickFile	Clicks on the specified image. (Inherited from <i>TestObject</i>)
ImageExists	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
ImageExistsFile	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
Input	Dispatched when the user types, deletes, or pastes text into the control. (Inherited from <i>SparkSkinnableTextBase</i>)
Invoke	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
InvokeMethods	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
MouseScroll	Dispatched when the mouse is used to move the scroll bars on this container. (Inherited from <i>SparkSkinnableTextBase</i>)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from <i>FlexObject</i>)

Name	Description
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SelectText	Dispatched when text is selected. (Inherited from SparkSkinnableTextBase)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key. (Inherited from SparkSkinnableTextBase)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object,

Name	Description
	for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkTileGroup Class

Description

The `TileGroup` container is an instance of the `Group` container that uses the `TileLayout` class.

Inheritance Hierarchy

- [SparkGroup](#)
 - `SparkTileGroup`

Syntax

```
'Declaration
Public Class SparkTileGroup _
Inherits SparkGroup
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
autoLayout	a value whether measurement and layout are done when the position or size of a child is changed. (Inherited from SparkGroupBase)

Name	Description
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i>)
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>blendMode</i>	A value from the BlendMode class that specifies which blend mode to use. (Inherited from <i>SparkGroup</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>clipAndEnableScrolling</i>	a value whether to clip the children to the boundaries of the viewport. (Inherited from <i>SparkGroupBase</i>)
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>SparkGroupBase</i>)
<i>contentHeight</i>	The height of the viewport's content. (Inherited from <i>SparkGroupBase</i>)
<i>contentWidth</i>	The width of the viewport's contents. (Inherited from <i>SparkGroupBase</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>SparkGroupBase</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>horizontalScrollPosition</i>	The x coordinate of the origin of the viewport in the component's coordinate system, where the default value is (0,0) corresponding to the upper-left corner of the component (Inherited from <i>SparkGroupBase</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>SparkGroupBase</i>)
<i>luminosityClip</i>	a value whether the luminosity mask clips the masked content. (Inherited from <i>SparkGroupBase</i>)

Name	Description
luminosityInvert	a value that controls the calculation of the RGB color value of a graphic element being masked by a luminosity mask. (Inherited from SparkGroupBase)
maskType	The mask type. (Inherited from SparkGroupBase)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from FlexDisplayObject)
mouseEnabledWhereTransparent	a value whether the entire bounds of the Group respond to mouse events such as click and roll over. (Inherited from SparkGroupBase)
numAutomationChildren	the number of automation children this container has. (Inherited from FlexObject)
numColumns	the total number of columns in the data available. (Inherited from SparkGroupBase)
numElements	The number of visual elements in this container. (Inherited from SparkGroupBase)
numRows	the total number of rows of data available. (Inherited from SparkGroupBase)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from FlexObject)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from FlexObject)
resizeMode	The ResizeMode for this container. (Inherited from SparkGroupBase)
scaleGridBottom	the bottom coordinate of the scale grid. (Inherited from SparkGroup)
scaleGridLeft	the left coordinate of the scale grid. (Inherited from SparkGroup)
scaleGridRight	the right coordinate of the scale grid. (Inherited from SparkGroup)
scaleGridTop	the top coordinate of the scale grid. (Inherited from SparkGroup)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from FlexObject)
scaleY	the number that specifies the vertical scaling factor. (Inherited from FlexObject)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from FlexDisplayObject)

Name	Description
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TestObject)
themeColor	the theme color of a component. (Inherited from FlexObject)
toolTip	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from FlexObject)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is <code>true</code> . If <code>useHandCursor</code> is <code>false</code> , the arrow pointer is used instead. (Inherited from FlexObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
verticalScrollPosition	The y coordinate of the origin of the viewport in the component's coordinate system, where the default value is (0,0) corresponding to the upper-left corner of the component. (Inherited from SparkGroupBase)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)

Name	Description
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from SparkGroupBase)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from SparkGroupBase)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from SparkGroupBase)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject . (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from SparkGroupBase)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)

Name	Description
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MouseScroll	Dispatched when the mouse is used to move the scroll bars on this container. (Inherited from SparkGroupBase)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Scroll	Dispatched when the container's scroll events occur. This event is dispatched if the scrolling is done programmatically or by the user. (Inherited from SparkGroupBase)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)

Name	Description
Type	Dispatched when the user presses a key. (Inherited from SparkGroupBase)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkTitleWindow Class

Description

The `TitleWindow` class extends `Panel` to include a close button and move area.

Inheritance Hierarchy

- [SparkPanel](#)
 - SparkTitleWindow

Syntax

```
'Declaration  
Public Class SparkTitleWindow _  
Inherits SparkPanel
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
autoLayout	whether measurement and layout are done when the position or size of a child is changed. (Inherited from SparkSkinnableContainer)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
columnNames	a list containing the names of all columns in the data. (Inherited from SparkSkinnableContainerBase)
controlBarVisible	a value whether the control bar is visible. (Inherited from SparkPanel)
creationPolicy	the content creation policy for this component. (Inherited from SparkSkinnableContainer)
currentState	the current view state of the component. (Inherited from FlexObject)
deferredContentCreated	whether deferred content has been created. (Inherited from SparkSkinnableContainer)
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from FlexObject)
firstVisibleRow	the index of the first visible child. (Inherited from SparkSkinnableContainerBase)

Name	Description
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>numElements</i>	The number of visual elements in this container. (Inherited from <i>SparkSkinnableContainer</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>title</i>	the title or caption displayed in the title bar. (Inherited from <i>SparkPanel</i>)

Name	Description
<code>toolTip</code>	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from <code>FlexObject</code>)
<code>useHandCursor</code>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <code>useHandCursor</code> is false, the arrow pointer is used instead. (Inherited from <code>FlexObject</code>)
<code>Value</code>	The value of the control, e.g.: text in a text control. (Inherited from <code>TestObject</code>)
<code>visible</code>	whether the display object is visible. (Inherited from <code>FlexDisplayObject</code>)
<code>width</code>	the width of the display object, in pixels. (Inherited from <code>FlexDisplayObject</code>)
<code>x</code>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <code>FlexDisplayObject</code>)
<code>y</code>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <code>FlexDisplayObject</code>)

Methods

Name	Description
<code>CaptureBitmap</code>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <code>TestObject</code>)
<code>ChangeFocus</code>	Changes the current focus. (Inherited from <code>FlexObject</code>)
<code>Click</code>	Clicks on the object. (Inherited from <code>IClickable</code>)
<code>DoubleClick</code>	Double-clicks a mouse button on the object. (Inherited from <code>IClickable</code>)
<code>DragCancel</code>	Dispatched when a drag operation is cancelled. (Inherited from <code>SparkSkinnableContainerBase</code>)
<code>DragDrop</code>	Dispatched when the dragged item is dropped. (Inherited from <code>SparkSkinnableContainerBase</code>)
<code>DragStart</code>	Dispatched when the drag/drop operation begins. (Inherited from <code>SparkSkinnableContainerBase</code>)
<code>Exists</code>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <code>TestObject</code>)

Name	Description
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>GetStyle</i>	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from <i>FlexDisplayObject</i>)
<i>GetValues</i>	Returns a matrix containing the automation values of all parts of the components. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)

Name	Description
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key. (Inherited from SparkPanel)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkToggleButton Class

Description

The `ToggleButton` component defines a toggle button. Clicking the button toggles it between the up and an down states.

Inheritance Hierarchy

- [SparkToggleButtonBase](#)
 - `SparkToggleButton`
 - [SparkButtonBarButton](#)

Syntax

```
'Declaration
Public Class SparkToggleButton _
Inherits SparkToggleButtonBase
```

Properties

Name	Description
<i>alpha</i>	the alpha transparency value of the object specified. (Inherited from <i>FlexDisplayObject</i>)
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i>)
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>autoRepeat</i>	whether to dispatch repeated buttonDown events if the user holds down the mouse button. (Inherited from <i>SparkButtonBase</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>label</i>	the text to appear on the ButtonBase control. (Inherited from <i>SparkButtonBase</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is

Name	Description
	NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>selected</i>	whether the button is in the down state, and false if it is in the up state. (Inherited from <i>SparkToggleButtonBase</i>)
<i>stickyHighlighting</i>	a value whether the button displays its down skin when the user presses it but changes to its over skin when the user drags the mouse off of it. (Inherited from <i>SparkButtonBase</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is <i>Nothing</i> . (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If <i>useHandCursor</i> is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored

Name	Description
	in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	The event triggered when a drag operation is cancelled.
DragDrop	The event triggered when the dragged item is dropped.
DragStart	The event triggered when the drag/drop operation begins.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)

Name	Description
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)

Name	Description
Type	Dispatched when the user presses a key. (Inherited from SparkButtonBase)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkToggleButtonBase Class

Description

The `ToggleButtonBase` component is the base class for the Spark button components that support the selected property.

Inheritance Hierarchy

- [SparkButtonBase](#)
 - `SparkToggleButtonBase`
 - [SparkCheckBox](#)
 - [SparkRadioButton](#)
 - [SparkToggleButton](#)

Syntax

```
'Declaration
Public Class SparkToggleButtonBase _
Inherits SparkButtonBase
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
autoRepeat	whether to dispatch repeated <code>buttonDown</code> events if the user holds down the mouse button. (Inherited from SparkButtonBase)
className	the name of this instance's class, such as <code>Button</code> . (Inherited from FlexObject)
currentState	the current view state of the component. (Inherited from FlexObject)
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from FlexObject)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from FlexObject)

Name	Description
height	the height of the display object, in pixels. (Inherited from FlexDisplayObject)
id	the ID of the component. (Inherited from FlexObject)
label	the text to appear on the ButtonBase control. (Inherited from SparkButtonBase)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from FlexDisplayObject)
numAutomationChildren	the number of automation children this container has. (Inherited from FlexObject)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from FlexObject)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from FlexObject)
scaleX	the number that specifies the horizontal scaling factor. (Inherited from FlexObject)
scaleY	the number that specifies the vertical scaling factor. (Inherited from FlexObject)
selected	whether the button is in the down state, and false if it is in the up state.
stickyHighlighting	a value whether the button displays its down skin when the user presses it but changes to its over skin when the user drags the mouse off of it. (Inherited from SparkButtonBase)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from FlexDisplayObject)
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TestObject)
themeColor	the theme color of a component. (Inherited from FlexObject)
toolTip	the text to display in the ToolTip. The default value is Nothing. (Inherited from FlexObject)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from FlexObject)

Name	Description
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>ChangeFocus</i>	Changes the current focus. (Inherited from <i>FlexObject</i>)
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i>)
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i>)
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)

Name	Description
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key. (Inherited from SparkButtonBase)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
WaitForPropertyNotEquals	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkTrackBase Class

Description

The TrackBase class is a base class for components with a track and one or more thumb buttons, such as Slider and ScrollBar.

Inheritance Hierarchy

- [SparkRange](#)
 - SparkTrackBase
 - [SparkScrollBar](#)
 - [SparkSlider](#)

Syntax

```
'Declaration
Public Class SparkTrackBase _
Inherits SparkRange
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)

Name	Description
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>maximum</i>	The maximum valid value. (Inherited from <i>SparkRange</i>)
<i>minimum</i>	The minimum valid value. (Inherited from <i>SparkRange</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>snapInterval</i>	the snapInterval. (Inherited from <i>SparkRange</i>)
<i>stepSize</i>	The amount that the value property changes when the changeValueByStep() method is called. (Inherited from <i>SparkRange</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)

Name	Description
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TestObject)
themeColor	the theme color of a component. (Inherited from FlexObject)
toolTip	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from FlexObject)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is <code>true</code> . If <code>useHandCursor</code> is <code>false</code> , the arrow pointer is used instead. (Inherited from FlexObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
value	The current value for this range. (Inherited from SparkRange)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Change	Dispatched when the value of the NumericStepper changes as a result of user interaction.
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)

Name	Description
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)

Name	Description
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)</p>

SparkVideoDisplay Class

Description

Identifies a Spark video display control.

Inheritance Hierarchy

- [FlexObject](#)
 - SparkVideoDisplay

Syntax

```
'Declaration
Public Class SparkVideoDisplay _
Inherits FlexObject
```

Properties

Name	Description
<i>alpha</i>	the alpha transparency value of the object specified. (Inherited from <i>FlexDisplayObject</i>)
<i>autoDisplayFirstFrame</i>	whether the video is loaded when the source is set.
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i>)
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>autoPlay</i>	whether the video starts playing immediately when the source property is set.
<i>autoRewind</i>	whether the FLV file should rewind to the first frame when play stops.
<i>bytesLoaded</i>	the number of bytes of data that have been downloaded into the application.
<i>bytesTotal</i>	the total size in bytes of the data being downloaded into the application.
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>currentTime</i>	the current time of the playhead, measured in seconds, since the video starting playing.
<i>duration</i>	the duration of the video's playback, in seconds.
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>loop</i>	whether the media should play again after playback has completed.
<i>mediaPlayerState</i>	the current state of the video.
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any <i>InteractiveObject</i> instance that is on the display list receives mouse events. If <i>mouseEnabled</i> is set to false, the instance does not receive any mouse events. Any children of

Name	Description
	this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>muted</i>	whether the video is muted.
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>pauseWhenHidden</i>	whether the video continues to play when it is "hidden".
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>playing</i>	a value whether the video is playing or is attempting to play.
<i>scaleMode</i>	the different ways of sizing the video content.
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>toolTip</i>	the text to display in the ToolTip. The default value is Nothing. (Inherited from <i>FlexObject</i>)
<i>useHandCursor</i>	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from <i>FlexObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>visible</i>	whether the display object is visible. (Inherited from <i>FlexDisplayObject</i>)
<i>volume</i>	the volume level, specified as a value between 0 and 1.
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)

Name	Description
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>ChangeFocus</i>	Changes the current focus. (Inherited from <i>FlexObject</i>)
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i>)
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i>)
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <i>TestObject</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)

Name	Description
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)

Name	Description
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If

Name	Description
	you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkVideoPlayer Class

Description

The VideoPlayer control is a skinnable video player that supports progressive download, multi-bitrate streaming, and streaming video.

Inheritance Hierarchy

- [SparkObject](#)
 - SparkVideoPlayer

Syntax

```
'Declaration
Public Class SparkVideoPlayer _
Inherits SparkObject
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
currentState	the current view state of the component. (Inherited from FlexObject)
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from FlexObject)
focusEnabled	whether the component can receive focus when tabbed to. (Inherited from FlexObject)

Name	Description
height	the height of the display object, in pixels. (Inherited from FlexDisplayObject)
id	the ID of the component. (Inherited from FlexObject)
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from FlexDisplayObject)
muted	a value whether the control is muted.
numAutomationChildren	the number of automation children this container has. (Inherited from FlexObject)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from FlexObject)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from FlexObject)
playing	a value if the video is playing or is attempting to play.
scaleX	the number that specifies the horizontal scaling factor. (Inherited from FlexObject)
scaleY	the number that specifies the vertical scaling factor. (Inherited from FlexObject)
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from FlexDisplayObject)
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TestObject)
themeColor	the theme color of a component. (Inherited from FlexObject)
toolTip	the text to display in the ToolTip. The default value is Nothing. (Inherited from FlexObject)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is true. If useHandCursor is false, the arrow pointer is used instead. (Inherited from FlexObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
volume	The volume level, specified as a value between 0 and 1.

Name	Description
<i>width</i>	the width of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>x</i>	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)
<i>y</i>	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from <i>FlexDisplayObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>ChangeFocus</i>	Changes the current focus. (Inherited from <i>FlexObject</i>)
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i>)
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i>)
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <i>TestObject</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)

Name	Description
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)

Name	Description
 SetProperty 	Sets the value of the specified property. (Inherited from TestObject)
 TextCapture 	Returns the text in this object's visible area. (Inherited from TestObject)
 TextClick 	Clicks in the center of the specified text. (Inherited from TestObject)
 TextExists 	Returns whether the specified text exists. (Inherited from TestObject)
 TextRectangle 	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
 ToString 	Returns a string representation of the control. (Inherited from FlexDisplayObject)
 TypeKeys 	Sends a set of keystrokes to the object. (Inherited from IKeyable)
 TypePasswordKeys 	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
 WaitForChildDisappearance 	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForDisappearance 	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForObject 	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
 WaitForProperty 	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForPropertyNotEquals 	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
