Name	Description
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkVolumeBar Class

Description

The VolumeBar class defines a drop-down slider to control the volume of the VideoDisplay control.

Inheritance Hierarchy

- [SparkSlider](#)
 - SparkVolumeBar

Syntax

```
'Declaration
Public Class SparkVolumeBar _
Inherits SparkSlider
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)
automationIndex	a string containing the automation index for the element. (Inherited from FlexObject)
automationName	the name that can be used as an identifier for this object. (Inherited from FlexObject)
className	the name of this instance's class, such as <i>Button</i> . (Inherited from FlexObject)
currentState	the current view state of the component. (Inherited from FlexObject)
enabled	whether the component can accept user interaction. (Inherited from FlexObject)
errorColor	the color of the component highlight when validation fails. (Inherited from FlexObject)
errorString	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from FlexObject)

Name	Description
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>isDropDownOpen</i>	a value whether the volumebar is open.
<i>maximum</i>	The maximum valid value. (Inherited from <i>SparkRange</i>)
<i>minimum</i>	The minimum valid value. (Inherited from <i>SparkRange</i>)
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>muted</i>	a value whether the control is muted.
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>snapInterval</i>	the snapInterval. (Inherited from <i>SparkRange</i>)
<i>stepSize</i>	The amount that the value property changes when the changeValueByStep() method is called. (Inherited from <i>SparkRange</i>)
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)

Name	Description
toolTip	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from FlexObject)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is <code>true</code> . If <code>useHandCursor</code> is <code>false</code> , the arrow pointer is used instead. (Inherited from FlexObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
value	The current value for this range. (Inherited from SparkRange)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Change	Dispatched when the value of the NumericStepper changes as a result of user interaction. (Inherited from SparkTrackBase)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)

Name	Description
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)

Name	Description
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from FlexObject)
MuteChange	Dispatched when the mute status changes as a result of user interaction.
Open	Dispatched when the user clicks the drop-down button to display the drop-down list.
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key. (Inherited from SparkTrackBase)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
WaitForObject	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject) Waits for an object that matches the specified locator. If no object matches within a timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkWindow Class

Description

The Window is a top-level container for additional windows in an AIR desktop application.

Inheritance Hierarchy

- [SparkSkinnableContainer](#)
 - SparkWindow

Syntax

```
'Declaration
Public Class SparkWindow _
Inherits SparkSkinnableContainer _
Implements IMoveable
```

Properties

Name	Description
<i>alpha</i>	the alpha transparency value of the object specified. (Inherited from <i>FlexDisplayObject</i>)
<i>alwaysInFront</i>	a value whether the underlying <i>NativeWindow</i> is always in front of other windows.
<i>autoLayout</i>	whether measurement and layout are done when the position or size of a child is changed. (Inherited from <i>SparkSkinnableContainer</i>)
<i>automationClassName</i>	a string containing the automation class name for the element. (Inherited from <i>FlexObject</i>)
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>closed</i>	a value whether the underlying window has been closed.
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>creationPolicy</i>	the content creation policy for this component. (Inherited from <i>SparkSkinnableContainer</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>deferredContentCreated</i>	whether deferred content has been created. (Inherited from <i>SparkSkinnableContainer</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>isAIRWindow</i>	a value whether this window is an AIR window.
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>SparkSkinnableContainerBase</i>)

Name	Description
maxHeight	The maximum recommended height of the component to be considered by the parent during layout.
maximizable	a value whether the window can be maximized.
maxWidth	The maximum recommended width of the component to be considered by the parent during layout.
minHeight	The minimum recommended height of the component to be considered by the parent during layout.
minimizable	a value whether the window can be minimized.
minWidth	The minimum recommended width of the component to be considered by the parent during layout.
mouseEnabled	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from FlexDisplayObject)
numAutomationChildren	the number of automation children this container has. (Inherited from FlexObject)
numColumns	the total number of columns in the data available. (Inherited from SparkSkinnableContainerBase)
numElements	The number of visual elements in this container. (Inherited from SparkSkinnableContainer)
numRows	the total number of rows of data available. (Inherited from SparkSkinnableContainerBase)
percentHeight	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from FlexObject)
percentWidth	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from FlexObject)
resizable	a value whether the window can be resized.
scaleX	the number that specifies the horizontal scaling factor. (Inherited from FlexObject)
scaleY	the number that specifies the vertical scaling factor. (Inherited from FlexObject)
showStatusBar	a value whether the status bar is visible.
status	The string that appears in the status bar, if it is visible.
systemChrome	the type of system chrome (if any) the window has.
tabChildren	whether the children of the display object are tab enabled. The default is true. (Inherited from FlexDisplayObject)

Name	Description
tabEnabled	whether this object is in the tab order. (Inherited from FlexDisplayObject)
tabIndex	the tab ordering of objects in a SWF file. (Inherited from FlexDisplayObject)
Text	The text of the control. (Inherited from TestObject)
themeColor	the theme color of a component. (Inherited from FlexObject)
title	The title that appears in the window title bar and the taskbar.
toolTip	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from FlexObject)
transparent	a value whether the window is transparent.
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is <code>true</code> . If <code>useHandCursor</code> is <code>false</code> , the arrow pointer is used instead. (Inherited from FlexObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
WindowState	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from IMoveable)
x	the x coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from FlexDisplayObject)
y	the y coordinate of the <code>DisplayObject</code> instance relative to the local coordinates of the parent <code>DisplayObjectContainer</code> . (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
Close	Closes the window. (Inherited from IMoveable)

Name	Description
CloseSynchron	Closes the window and waits until the window is closed. (Inherited from IMoveable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from SparkSkinnableContainerBase)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from SparkSkinnableContainerBase)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from SparkSkinnableContainerBase)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetCloseWindows	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from IMoveable)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetFocus	Returns the object with the input focus. (Inherited from IMoveable)
GetNextCloseWindow	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from IMoveable)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)

Name	Description
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from SparkSkinnableContainerBase)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsActive	Returns whether the window is set to active. (Inherited from IMoveable)
Maximize	Maximizes the window. (Inherited from IMoveable)
Minimize	Reduces the window to an icon. (Inherited from IMoveable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from IMoveable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Restore	Restores the window to its previous size. (Inherited from IMoveable)
SetActive	Makes the window active. (Inherited from IMoveable)

Name	Description
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
Size	Resizes the window. (Inherited from IMoveable)
StateChange	Dispatched when the displaystatus of the window is changed.
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SparkWindowedApplication Class

Description

The WindowedApplication defines the application container that you use to create Flex applications for AIR applications.

Inheritance Hierarchy

- [SparkApplication](#)
 - SparkWindowedApplication

Syntax

```
'Declaration
Public Class SparkWindowedApplication _
Inherits SparkApplication _
Implements IMoveable
```

Properties

Name	Description
alpha	the alpha transparency value of the object specified. (Inherited from FlexDisplayObject)
alwaysInFront	a value whether the underlying NativeWindow is always in front of other windows.
applicationID	The identifier that AIR uses to identify the application.
autoExit	a value whether the AIR application will quit when the last window closes or will continue running in the background.
autoLayout	whether measurement and layout are done when the position or size of a child is changed. (Inherited from SparkSkinnableContainer)
automationClassName	a string containing the automation class name for the element. (Inherited from FlexObject)

Name	Description
<i>automationIndex</i>	a string containing the automation index for the element. (Inherited from <i>FlexObject</i>)
<i>automationName</i>	the name that can be used as an identifier for this object. (Inherited from <i>FlexObject</i>)
<i>className</i>	the name of this instance's class, such as <i>Button</i> . (Inherited from <i>FlexObject</i>)
<i>closed</i>	a value whether the underlying window has been closed.
<i>colorCorrection</i>	The value of the stage's <i>colorCorrection</i> property. (Inherited from <i>SparkApplication</i>)
<i>columnNames</i>	a list containing the names of all columns in the data. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>controlBarVisible</i>	whether the control bar is visible. (Inherited from <i>SparkApplication</i>)
<i>creationPolicy</i>	the content creation policy for this component. (Inherited from <i>SparkSkinnableContainer</i>)
<i>currentState</i>	the current view state of the component. (Inherited from <i>FlexObject</i>)
<i>deferredContentCreated</i>	whether deferred content has been created. (Inherited from <i>SparkSkinnableContainer</i>)
<i>enabled</i>	whether the component can accept user interaction. (Inherited from <i>FlexObject</i>)
<i>errorColor</i>	the color of the component highlight when validation fails. (Inherited from <i>FlexObject</i>)
<i>errorString</i>	the text that will be displayed by a component's error tip when a component is monitored and validation fails. (Inherited from <i>FlexObject</i>)
<i>firstVisibleRow</i>	the index of the first visible child. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>focusEnabled</i>	whether the component can receive focus when tabbed to. (Inherited from <i>FlexObject</i>)
<i>height</i>	the height of the display object, in pixels. (Inherited from <i>FlexDisplayObject</i>)
<i>id</i>	the ID of the component. (Inherited from <i>FlexObject</i>)
<i>lastVisibleRow</i>	the index of the last visible child. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>maxHeight</i>	The maximum recommended height of the component to be considered by the parent during layout.
<i>maximizable</i>	a value whether the window can be maximized.
<i>maxWidth</i>	The maximum recommended width of the component to be considered by the parent during layout.
<i>minHeight</i>	The minimum recommended height of the component to be considered by the parent during layout.

Name	Description
<i>minimizable</i>	a value whether the window can be minimized.
<i>minWidth</i>	The minimum recommended width of the component to be considered by the parent during layout.
<i>mouseEnabled</i>	whether this object receives mouse messages. The default value is true, which means that by default any InteractiveObject instance that is on the display list receives mouse events. If mouseEnabled is set to false, the instance does not receive any mouse events. Any children of this instance on the display list are not affected. To change the mouseEnabled behavior for all children of an object on the display list, use flash.display.DisplayObjectContainer.mouseChildren. (Inherited from <i>FlexDisplayObject</i>)
<i>numAutomationChildren</i>	the number of automation children this container has. (Inherited from <i>FlexObject</i>)
<i>numColumns</i>	the total number of columns in the data available. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>numElements</i>	The number of visual elements in this container. (Inherited from <i>SparkSkinnableContainer</i>)
<i>numRows</i>	the total number of rows of data available. (Inherited from <i>SparkSkinnableContainerBase</i>)
<i>percentHeight</i>	the number that specifies the height of a component as a percentage of its parent's size. (Inherited from <i>FlexObject</i>)
<i>percentWidth</i>	the number that specifies the width of a component as a percentage of its parent's size. Allowed values are 0-100. The default value is NaN. Setting the width or explicitWidth properties resets this property to NaN. (Inherited from <i>FlexObject</i>)
<i>resizable</i>	a value whether the window can be resized.
<i>scaleX</i>	the number that specifies the horizontal scaling factor. (Inherited from <i>FlexObject</i>)
<i>scaleY</i>	the number that specifies the vertical scaling factor. (Inherited from <i>FlexObject</i>)
<i>showStatusBar</i>	a value whether the status bar is visible.
<i>status</i>	The string that appears in the status bar, if it is visible.
<i>systemChrome</i>	the type of system chrome (if any) the window has.
<i>tabChildren</i>	whether the children of the display object are tab enabled. The default is true. (Inherited from <i>FlexDisplayObject</i>)
<i>tabEnabled</i>	whether this object is in the tab order. (Inherited from <i>FlexDisplayObject</i>)
<i>tabIndex</i>	the tab ordering of objects in a SWF file. (Inherited from <i>FlexDisplayObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>themeColor</i>	the theme color of a component. (Inherited from <i>FlexObject</i>)
<i>title</i>	The title that appears in the window title bar and the taskbar.

Name	Description
toolTip	the text to display in the ToolTip. The default value is <code>Nothing</code> . (Inherited from FlexObject)
transparent	a value whether the window is transparent.
url	The URL from which this Application's SWF file was loaded. (Inherited from SparkApplication)
useHandCursor	whether the pointing hand cursor appears when the mouse rolls over an element. The default value is <code>true</code> . If <code>useHandCursor</code> is <code>false</code> , the arrow pointer is used instead. (Inherited from FlexObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
viewSourceURL	the URL where the application's source can be viewed. (Inherited from SparkApplication)
visible	whether the display object is visible. (Inherited from FlexDisplayObject)
width	the width of the display object, in pixels. (Inherited from FlexDisplayObject)
WindowState	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from IMoveable)
x	the x coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)
y	the y coordinate of the DisplayObject instance relative to the local coordinates of the parent DisplayObjectContainer. (Inherited from FlexDisplayObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeFocus	Changes the current focus. (Inherited from FlexObject)
Click	Clicks on the object. (Inherited from IClickable)
Close	Closes the window. (Inherited from IMoveable)
CloseSynchron	Closes the window and waits until the window is closed. (Inherited from IMoveable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)

Name	Description
DragCancel	Dispatched when a drag operation is cancelled. (Inherited from SparkSkinnableContainerBase)
DragDrop	Dispatched when the dragged item is dropped. (Inherited from SparkSkinnableContainerBase)
DragStart	Dispatched when the drag/drop operation begins. (Inherited from SparkSkinnableContainerBase)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetCloseWindows	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from IMoveable)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetFocus	Returns the object with the input focus. (Inherited from IMoveable)
GetNextCloseWindow	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from IMoveable)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetStyle	Returns the style value for the given style. For available styles consider the Apache Flex sdk documentation. (Inherited from FlexDisplayObject)

Name	Description
GetValues	Returns a matrix containing the automation values of all parts of the components. (Inherited from SparkSkinnableContainerBase)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsActive	Returns whether the window is set to active. (Inherited from IMoveable)
Maximize	Maximizes the window. (Inherited from IMoveable)
Minimize	Reduces the window to an icon. (Inherited from IMoveable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the component to a specified position within its parent. Calling this method is the same as setting the component's x and y properties. (Inherited from IMoveable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Restore	Restores the window to its previous size. (Inherited from IMoveable)
SetActive	Makes the window active. (Inherited from IMoveable)
SetFocus	Sets the focus to this component. The component may in turn pass focus to a subcomponent. (Inherited from FlexObject)

Name	Description
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
Size	Resizes the window. (Inherited from IMoveable)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ToString	Returns a string representation of the control. (Inherited from FlexDisplayObject)
Type	Dispatched when the user presses a key. (Inherited from SparkApplication)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly

Name	Description
WaitForScreenshotStable	pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject) Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Java SWT Class Reference

Lists the available classes for testing Java SWT controls.

CBanner Class

Description

The class used to layout the toolbar area and perspective switching toolbar in the workbench.

Inheritance Hierarchy

- [Control](#)
 - CBanner

Syntax

```
'Declaration
Public Class CBanner _
Inherits Control
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from GuiTestObject)
Bottom	The control located at the bottom of the banner.
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
Left	The control located on the left side of the banner.
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)

Name	Description
Right	The control located on the right side of the banner.
RightMinimumSize	The minimum size of the control located on the right side of the banner.
RightWidth	The width of the control located on the right side of the banner.
Simple	Whether the banner is rendered with a simple, traditional shape.
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)

Name	Description
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>GetHorizontalBar</i>	Returns the horizontal scroll bar for this control. (Inherited from <i>IScrollable</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>GetVerticalBar</i>	Returns the vertical scroll bar for this control. (Inherited from <i>IScrollable</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>OpenContextMenu</i>	Opens a context menu at the specified position. (Inherited from <i>BaseGuiTestObject</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)

Name	Description
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout

Name	Description
	specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

CoolBar Class

Description

A container class that contains SWT widgets, primarily toolbars.

Inheritance Hierarchy

- [Control](#)
 - CoolBar

Syntax

```
'Declaration
Public Class CoolBar _
Inherits Control
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from GuiTestObject)
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
ItemCount	The number of items in the coolbar.
Items	A list of items in the coolbar.
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this

Name	Description
	property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from IScrollable)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from IScrollable)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from BaseGuiTestObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)

Name	Description
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

CoolItem Class

Description

Contains selectable user interface objects that represent the areas of a CoolBar that can be dynamically positioned.

Inheritance Hierarchy

- [Item](#)
 - CoolItem

Syntax

```
'Declaration
Public Class CoolItem _
Inherits Item
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from GuiTestObject)
Content	The content of the areas that can be dynamically positioned.
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant

Name	Description
	<i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)

Name	Description
	setting the value of the option <i>OPT_WAIT_RESOLVE_OBJDEF</i> . Use <i>WaitForObject</i> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <i>WaitForObject</i> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <i>WaitForObject</i> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <i>OPT_WAIT_RESOLVE_OBJDEF</i> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <i>OPT_WAIT_RESOLVE_OBJDEF</i> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <i>OPT_WAIT_RESOLVE_OBJDEF</i> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

CTabFolder Class

Description

Class for an enhanced tab folder, typically having decorated tabs and the minimize, maximize, and close buttons.

Inheritance Hierarchy

- *Control*
 - CTabFolder

Syntax

```
'Declaration
Public Class CTabFolder _
Inherits Control
```

Properties

Name	Description
<i>Background</i>	The background color of the GUI object. (Inherited from <i>GuiTestObject</i>)

Name	Description
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
ItemCount	The number of items in the tab folder.
Items	A list of items in the tab folder.
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
SelectedIndex	The index of the selected item.
SelectedItem	The selected tab item.
SelectedItemText	The text of the selected item or an empty string if no item is selected.
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
Close	Closes the visible page.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)

Name	Description
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from IScrollable)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from IScrollable)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
Maximize	Resizes the CTabFolder to its full (maximized) size.
Minimize	Resizes the CTabFolder to the minimum size allowed.

Name	Description
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from BaseGuiTestObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Restore	Restores the CTabFolder to its previous size.
Select	Selects an item from the CTabFolder.
SelectList	Selects one or more items in the tab.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by

Name	Description
	setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

CTabItem Class

Description

The class for an enhanced tab within a `CTabFolder`.

Inheritance Hierarchy

Name	Description
	results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

HorizontalSash Class

Description

The class for the horizontal border around a window pane that can be dragged to adjust the window size.

Inheritance Hierarchy

- [Sash](#)
 - HorizontalSash

Syntax

```
'Declaration
Public Class HorizontalSash _
Inherits Sash
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from GuiTestObject)
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)

Name	Description
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)

Name	Description
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from IScrollable)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from IScrollable)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject . (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the window pane that the sash borders. (Inherited from Sash)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from BaseGuiTestObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)

Name	Description
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used.

Name	Description
	An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

ScrollableControl Class

Description

The implementation class for all controls which are only classified as controls but also contain a scrollbar.

Inheritance Hierarchy

- [Control](#)
 - ScrollableControl

Syntax

```
'Declaration
Public Class ScrollableControl _
Inherits Control
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from GuiTestObject)
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from BaseGuiTestObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

ScrolledComposite Class

Description

The class for scrollbars and scrolls the content when the user uses the scrollbars.

Inheritance Hierarchy

- [Control](#)
 - ScrolledComposite

Syntax

```
'Declaration
Public Class ScrolledComposite _
Inherits Control
```

Properties

Name	Description
AlwaysShowScrollBars	Whether the scrollbar shows.
Background	The background color of the GUI object. (Inherited from GuiTestObject)
Content	The content of the areas that can be dynamically positioned.
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Origin	The point in the content that currently appears in the top left corner of the scrolled composite.
Text	The text of the control. (Inherited from TestObject)

Name	Description
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from IScrollable)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)

Name	Description
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>GetVerticalBar</i>	Returns the vertical scroll bar for this control. (Inherited from <i>IScrollable</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>OpenContextMenu</i>	Opens a context menu at the specified position. (Inherited from <i>BaseGuiTestObject</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)

Name	Description
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Shell Class

Description

The class for Java SWT windows.

Inheritance Hierarchy

- [Window](#)
 - Shell

Syntax

```
'Declaration  
Public Class Shell _  
Inherits Window
```

Properties

Name	Description
Application	The name of the Application that this Window belongs to. (Inherited from Window)
Background	The background color of the GUI object. (Inherited from GuiTestObject)
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)
WindowState	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from IMoveable)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored

Name	Description
	in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
Close	Closes the window. (Inherited from IMoveable)
CloseSynchron	Closes the window and waits until the window is closed. (Inherited from IMoveable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetCloseWindows	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from IMoveable)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject . (Inherited from TestObject)
GetFocus	Returns the object with the input focus. (Inherited from IMoveable)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from IScrollable)
GetNextCloseWindow	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from IMoveable)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from IScrollable)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsActive	Returns whether the window is set to active. (Inherited from IMoveable)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
Maximize	Maximizes the window. (Inherited from IMoveable)
Minimize	Reduces the window to an icon. (Inherited from IMoveable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the window. (Inherited from IMoveable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from BaseGuiTestObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Restore	Restores the window to its previous size. (Inherited from IMoveable)

Name	Description
SetActive	Makes the window active. (Inherited from IMoveable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
Size	Resizes the window. (Inherited from IMoveable)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used.

Name	Description
	An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Spinner Class

Description

The class to enter and modify numeric values for up/down controls.

Inheritance Hierarchy

- [Control](#)
 - Spinner

Syntax

```
'Declaration
Public Class Spinner _
Inherits Control
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from GuiTestObject)
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
IncrementCount	The amount to increase the position value of the spinner control after pressing it.
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
PageSize	The internal page size of the spinner control.
Position	The position for the up/down control.
Range	The range of the spinner control.
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Name	Description
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
Decrement	Decreases the value when the spinner controls are pressed.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from IScrollable)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)

Name	Description
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from IScrollable)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Increment	Increases the value when the spinner controls are pressed.
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from BaseGuiTestObject)
PageDecrement	Decreases the value when the page spinner controls are pressed.
PageIncrement	Increases the value when the page spinner controls are pressed.
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)

Name	Description
 SetProperty 	Sets the value of the specified property. (Inherited from TestObject)
 SetValue 	Sets the value for the spinner control.
 TextCapture 	Returns the text in this object's visible area. (Inherited from TestObject)
 TextClick 	Clicks in the center of the specified text. (Inherited from TestObject)
 TextExists 	Returns whether the specified text exists. (Inherited from TestObject)
 TextRectangle 	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
 TypeKeys 	Sends a set of keystrokes to the object. (Inherited from IKeyable)
 TypePasswordKeys 	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
 WaitForChildDisappearance 	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForDisappearance 	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForObject 	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
 WaitForProperty 	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForPropertyNotEquals 	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

StyledText Class

Description

The class for an editable user interface object that displays lines of text.

Inheritance Hierarchy

- [TextField](#)
 - [StyledText](#)

Syntax

```
'Declaration
Public Class StyledText _
Inherits TextField
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from GuiTestObject)
Editable	Whether the text is editable.
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
IsPassword	Whether the control is a password text field. (Inherited from TextField)
MultiLine	Whether the control is multiline. (Inherited from TextField)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Position	The position of the caret within the text field. (Inherited from TextField)
SelectedRange	The selected range within the text field. (Inherited from TextField)
SelectedText	The selected text within the text field. An empty string if no text is selected. (Inherited from TextField)
Text	The text of the control. (Inherited from TestObject)

Name	Description
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ClearText	Removes all text from the text field. (Inherited from TextField)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from IScrollable)
GetMultiText	Returns the specified lines of text in the multi-line text field. (Inherited from TextField)

Name	Description
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>GetVerticalBar</i>	Returns the vertical scroll bar for this control. (Inherited from <i>IScrollable</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>OpenContextMenu</i>	Opens a context menu at the specified position. (Inherited from <i>BaseGuiTestObject</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)

Name	Description
SetMultiText	Substitutes all or part of the lines in the multi-line text field. (Inherited from TextField)
SetPosition	Sets the insertion point in the text field. (Inherited from TextField)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
SetSelectionRange	Selects the specified range of the single-line or multi-line text field. (Inherited from TextField)
SetText	Substitutes new text for all or part of the text in the text field. (Inherited from TextField)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SWTBrowser Class

Description

The class for the browser widget.

Inheritance Hierarchy

- [Control](#)
 - SWTBrowser

Syntax

```
'Declaration
Public Class SWTBrowser _
Inherits Control
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from GuiTestObject)
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this

Name	Description
	property when an already located object in the application under test gets invisible during replay. (Inherited from <i>GuiTestObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i>)
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i>)
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <i>TestObject</i>)
<i>GetHorizontalBar</i>	Returns the horizontal scroll bar for this control. (Inherited from <i>IScrollable</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from IScrollable)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from BaseGuiTestObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)

Name	Description
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

SWTDateTime Class

Description

The class for SWT date and time elements in a calendar, date, or time control.

Inheritance Hierarchy

- [Control](#)
 - SWTDateTime

Syntax

```
'Declaration  
Public Class SWTDateTime _  
Inherits Control
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from GuiTestObject)
CurrentDate	The current date.
Day	The day.
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
Hours	The hour.
Minutes	The minute.
Month	The month.
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Seconds	The second.
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)
Year	The year.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)

The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

SWTTabControl Class

Description

The class for SWT TabFolder.

Inheritance Hierarchy

- [TabControl](#)
 - SWTTabControl

Syntax

```
'Declaration
Public Class SWTTabControl _
Inherits TabControl
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from GuiTestObject)
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
ItemCount	The number of items in the tab control. (Inherited from TabControl)
Items	A list of items in the tab control. (Inherited from TabControl)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
SelectedIndex	The index of the selected item. (Inherited from TabControl)
SelectedItem	The selected item. (Inherited from TabControl)
SelectedTabItem	The name of the selected item.
TabItems	A list of TabItems in the tab control.
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding.

<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Select	Selects a tab.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SWTTable Class

Description

The class for SWT tables.

Inheritance Hierarchy

- [Table](#)
 - SWTTable

Syntax

```
'Declaration
Public Class SWTTable _
Inherits Table
```

Properties

Name	Description
AllowsCheck	Whether the control can display a checkmark. (Inherited from Table)
AllowsMultiSelect	Whether the table supports selecting multiple items. (Inherited from Table)
Background	The background color of the GUI object. (Inherited from GuiTestObject)
ColumnCount	The number of columns in the table. (Inherited from Table)
ColumnItems	A list of all items in the column. (Inherited from Table)
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)

Name	Description
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
RowCount	The number of rows in the table. (Inherited from Table)
RowItems	A list of all table rows in the table. (Inherited from Table)
SelectedIndices	The indices of the selected item(s). (Inherited from Table)
SelectedItems	The selected item(s). (Inherited from Table)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Check	Checks the check box in the defined row of a table. (Inherited from Table)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DoubleClick	Double-clicks an item. (Inherited from Table)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
ExtendSelectRow	Selects a range of rows. (Inherited from Table)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)

Name	Description
FocusRow	Focuses on a row in the table. (Inherited from Table)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from IScrollable)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from IScrollable)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MultiSelectRow	Adds a row from the table to the set of selected rows. (Inherited from Table)

Name	Description
MultiUnselectRow	Removes a row from the set of selected rows. (Inherited from Table)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from BaseGuiTestObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SelectRow	Selects an row in the table. (Inherited from Table)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
Uncheck	Unchecks the check box in the defined row of a table. (Inherited from Table)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object,

Name	Description
	for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SWTTableColumn Class

Description

The class for columns in an SWT table.

Inheritance Hierarchy

- [TableColumn](#)
 - SWTTableColumn

Syntax

```
'Declaration
Public Class SWTTableColumn _
Inherits TableColumn
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from GuiTestObject)
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)

Name	Description
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)
Width	The width of the column. (Inherited from TableColumn)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)

Name	Description
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Resize	Resizes a column. (Inherited from TableColumn)
Select	Selects a column. (Inherited from TableColumn)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)

Name	Description
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SWTTableRow Class

Description

The class for rows in an SWT table.

Inheritance Hierarchy

- [TableRow](#)
 - SWTTableRow

Syntax

```
'Declaration
Public Class SWTTableRow _
Inherits TableRow
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from GuiTestObject)
Checked	Whether the check box in the row is checked. (Inherited from TableRow)
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
ItemCount	The number of items in the row. (Inherited from TableRow)
Items	A list of items in the row. (Inherited from TableRow)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)

FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)

Name	Description
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

Name	Description
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SWTTree Class

Description

The class for SWT tree widgets.

Inheritance Hierarchy

- [Tree](#)
 - SWTTree

Syntax

```
'Declaration
Public Class SWTTree _
Inherits Tree
```

Properties

Name	Description
AllowsCheck	Whether the control can display a checkmark. (Inherited from Tree)
AllowsMultiSelect	Whether the control supports selecting multiple items. (Inherited from Tree)
Background	The background color of the GUI object. (Inherited from GuiTestObject)
ColumnCount	The number of columns in the tree.
Columns	A list of columns in the tree.
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
ItemCount	The number of items in the tree (including all children). (Inherited from Tree)
ItemPaths	A list of items in the tree (including all children). (Inherited from Tree)
Items	A list of items in the tree (including all children). (Inherited from Tree)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
SelectedIndex	The index of the first selected item. (Inherited from Tree)
SelectedIndices	The indices of the selected item(s). (Inherited from Tree)
SelectedItem	The name of the first selected item. (Inherited from Tree)
SelectedItems	The names of the selected item(s). (Inherited from Tree)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)
VisibleItemPaths	A list of visible items in the tree (including all children). (Inherited from Tree)
VisibleItems	A list of visible items in the tree (including all children). (Inherited from Tree)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/

Name	Description
	<p>Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)</p>
Check	Checks the check box. (Inherited from Tree)
Click	Clicks on the object. (Inherited from IClickable)
Collapse	Collapses an item in a treeview control. (Inherited from Tree)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DoubleClick	Double-clicks an item. (Inherited from Tree)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Expand	Expands an object in a treeview control. (Inherited from Tree)
ExtendSelect	Selects a range of items by extending the selection.
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetContentsOfColumn	Retrieves the contents of the specified column as a list. To retrieve the contents of any column greater than column one, you must specify the parameters <code>rawMode</code> and <code>column</code> .
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this <code>TestObject</code> . (Inherited from TestObject)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from IScrollable)
GetItemPaths	Returns all items of the tree as a list of itempaths (Inherited from Tree)
GetItemRect	Returns the size and position of an item relative to the treeview control. (Inherited from Tree)
GetItemsOfColumn	Retrieve items of the specified column from <code>Tree</code>

Name	Description
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>GetSelectedTextOfColumn</i>	Retrieves selected text from the specified column
<i>GetVerticalBar</i>	Returns the vertical scroll bar for this control. (Inherited from <i>IScrollable</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsExpandable</i>	Checks if the given item can be expanded. (Inherited from <i>Tree</i>)
<i>IsExpanded</i>	Checks if the given item is expanded. (Inherited from <i>Tree</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>MultiSelect</i>	Adds an item from the tree to the set of selected items.
<i>MultiUnselect</i>	Removes an item in the tree from the set of selected items.
<i>OpenContextMenu</i>	Opens a context menu at the specified position. (Inherited from <i>BaseGuiTestObject</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Select	Selects an item from the tree. (Inherited from Tree)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
Uncheck	Unchecks the check box. (Inherited from Tree)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the

Name	Description
	optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SWTTreeColumn Class

Description

The class for columns in a Tree widget.

Inheritance Hierarchy

- [Item](#)
 - SWTTreeColumn

Syntax

```
'Declaration
Public Class SWTTreeColumn _
Inherits Item
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from GuiTestObject)
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)

Name	Description
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)
Width	The width of the column.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)

Name	Description
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Resize	Resizes a column of the tree.
Select	Selects a tree column.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)

Name	Description
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

VerticalSash Class

Description

The class for the vertical border around a window pane that can be dragged to adjust the window size.

Inheritance Hierarchy

- [Sash](#)
 - VerticalSash

Syntax

```

GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from IScrollable)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from IScrollable)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)

Name	Description
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the window pane that the sash borders. (Inherited from Sash)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from BaseGuiTestObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout

Name	Description
WaitForObject	parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject) Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option OPT_WAIT_RESOLVE_OBJDEF. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

ViewForm Class

Description

The class to lay out a view's label/menu/toolbar local bar in the workbench.

Inheritance Hierarchy

- [Control](#)
 - ViewForm

Syntax

```
'Declaration
Public Class ViewForm _
Inherits Control
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from GuiTestObject)
Content	The content of the areas that can be dynamically positioned.
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
TopCenter	The window located in the top center of the pane.
TopLeft	The window located in the top left of the pane.
TopRight	The window located in the top right of the pane.
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)

Name	Description
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Keyword-Driven Testing Class Reference

Lists the available classes for keyword-driven testing.

ArgumentAttribute Class

Description

Used to explicitly specify the name of an argument of a method that is marked as a keyword for keyword-driven testing.

Syntax

```
<AttributeUsageAttribute(AttributeTargets.Parameter>
Public Class ArgumentAttribute Inherits Attribute
```

Properties

Name	Description
Name Property (ArgumentAttribute)	Gets the name of the argument.

Example: Creating a keyword with two arguments

Use the following code sample to create the keyword *Login* with the arguments username and password:

```
<Keyword()>
Public Sub Login(<Argument("Name of the user")> username As
String, <Argument("Password of the user")> password As String)
' keyword implementation
End Sub
```

Example: Using arguments without a description

Use one of the following code samples to create the keyword *Login* with the arguments `username` and `password`, without using a description for the arguments:

```
<Keyword()>
Public Sub Login(username As String, password As String)
    ' keyword implementation
End Sub
```

```
<Keyword()>
Public Sub Login(<Argument> username As String, <Argument>
password As String)
    ' keyword implementation
End Sub
```

KeywordAttribute Class

Description

Specifies that a method is a keyword. If the name of the keyword is not specified the name of the annotated method is used as the keyword name.

Syntax

```
'Declaration
<AttributeUsageAttribute(AttributeTargets.Method>
Public Class KeywordAttribute Inherits Attribute
```

Properties

Name	Description
Name Property (KeywordAttribute)	Gets the name of the keyword. The default value is an empty string.
Description Property (KeywordAttribute)	Gets the description of the keyword. The default value is an empty string.

Example: Creating a keyword with two arguments

Use the following code sample to create the keyword *Login* with the arguments `username` and `password`:

```
<Keyword()>
Public Sub Login(username As String, password As String)
    ' keyword implementation
End Sub
```

Example: Specifying a keyword name

To specify the keyword name when creating a new keyword, use the following code sample:

```
<Keyword("Login user")>
Public Sub Login(username As String, password As String)
    ' keyword implementation
End Sub
```

KeywordGroupAttribute Class

Description

Specifies that a class is a keyword group. Methods within this class that are marked as keywords are keywords. The qualified name of these methods consists of the name of the keyword group and the name of the keyword. If the keyword group has no name, the simple name of the declaring class is used instead.

Syntax

```
'Declaration
<AttributeUsageAttribute(AttributeTargets.Class>
Public Class KeywordGroupAttribute Inherits Attribute
```

Properties

Name	Description
Name Property (KeywordGroupAttribute)	Gets the name of the keyword group. The default value is an empty string.

Example: Creating a keyword group

Use the following code sample to create the keyword group *LoginPage*:

```
<KeywordGroup()>
Public Class LoginPage
    ' keyword methods
End Class
```

Example: Specifying the name of the keyword group

Use one of the following code samples to create the keyword *Login* with the arguments *username* and *password*, without using a description for the arguments:

```
<KeywordGroup("Login Page")>
Public Class LoginPage
    ' keyword methods
End Class
```

Mobile Class Reference

Lists the available classes for testing Mobile controls.

IMobileClickable Interface

Description

Interface for objects that use clicks.

Syntax

```
'Declaration
Public Class IMobileClickable
```

Methods

Name	Description
Click	Clicks on the device at the specified coordinates.
DoubleClick	Double-clicks on the device at the specified coordinates.
LongClick	Long-clicks on the device at the specified coordinates.

IMobileGestures Interface

Description

Interface for objects that use long swipes.

Syntax

```
'Declaration  
Public Class IMobileGestures
```

Methods

Name	Description
Drag	Performs a drag operation between the two specified points.
MultiTouch	Performs a multi-touch operation with the given pointers. For every given pointer a swipe operation is executed at the same time.
PinchIn	Performs a two-pointer gesture, where each pointer moves toward the other, from the edges to the center of this object. For example to zoom out on an image.
PinchOut	Performs a two-pointer gesture, where each pointer moves opposite across the other, from the center out towards the edges of the this object. For example to zoom in on an image.
Swipe	Performs a swipe between the two specified points.
SwipeDown	Performs a down-swipe.
SwipeLeft	Performs a left-swipe.
SwipeRight	Performs a right-swipe.
SwipeUp	Performs a up-swipe.
SwipeWithSegments	Performs a swipe between the specified points.
TwoPointerMultiTouch	Performs a multi-touch operation with two pointers. It executes two swipe operation at the same time.

IMobileKeyable Interface

Description

Interface for objects that use keystrokes.

Syntax

```
'Declaration  
Public Class IMobileKeyable
```

Methods

Name	Description
TypeKeys	Sends a set of keystrokes to the object.

MobileButton Class

Description

Represents a mobile button. Mobile buttons can be clicked.

Inheritance Hierarchy

- [MobileObject](#)
 - MobileButton

Syntax

```
'Declaration
Public Class MobileButton _
Inherits MobileObject
```

Properties

Name	Description
IsEnabled	Whether the mobile object is enabled. (Inherited from MobileObject)
IsFocused	Whether the mobile object has focus. This property is not supported on iOS. (Inherited from MobileObject)
IsSelected	Whether the mobile object is selected or checked. (Inherited from MobileObject)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the device at the specified coordinates. (Inherited from IMobileClickable)
DoubleClick	Double-clicks on the device at the specified coordinates. (Inherited from IMobileClickable)

Name	Description
Drag	Performs a drag operation between the two specified points. (Inherited from IMobileGestures)
DragTo	Drags this object to the specified point relative to the mobile device. (Inherited from MobileObject)
DragToObject	Drags this object to the specified destination object. (Inherited from MobileObject)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)

Name	Description
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>LongClick</i>	Long-clicks on the device at the specified coordinates. (Inherited from <i>IMobileClickable</i>)
<i>MultiTouch</i>	Performs a multi-touch operation with the given pointers. For every given pointer a swipe operation is executed at the same time. (Inherited from <i>IMobileGestures</i>)
<i>PinchIn</i>	Performs a two-pointer gesture, where each pointer moves toward the other, from the edges to the center of this object. For example to zoom out on an image. (Inherited from <i>IMobileGestures</i>)
<i>PinchOut</i>	Performs a two-pointer gesture, where each pointer moves opposite across the other, from the center out towards the edges of the this object. For example to zoom in on an image. (Inherited from <i>IMobileGestures</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>Swipe</i>	Performs a swipe between the two specified points. (Inherited from <i>IMobileGestures</i>)
<i>SwipeDown</i>	Performs a down-swipe. (Inherited from <i>IMobileGestures</i>)
<i>SwipeLeft</i>	Performs a left-swipe. (Inherited from <i>IMobileGestures</i>)
<i>SwipeRight</i>	Performs a right-swipe. (Inherited from <i>IMobileGestures</i>)
<i>SwipeUp</i>	Performs a up-swipe. (Inherited from <i>IMobileGestures</i>)
<i>SwipeWithSegments</i>	Performs a swipe between the specified points. (Inherited from <i>IMobileGestures</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>TwoPointerMultiTouch</i>	Performs a multi-touch operation with two pointers. It executes two swipe operation at the same time. (Inherited from <i>IMobileGestures</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IMobileKeyable</i>)

Name	Description
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

MobileDevice Class

Description

The mobile device.

Inheritance Hierarchy

- [TestObject](#)
 - `MobileDevice`

Syntax

```
'Declaration
Public Class MobileDevice _
Inherits TestObject _
Implements IMobileClickable, IMobileGestures, IMobileKeyable
```

Properties

Name	Description
DeviceId	The id of the device for the current connection.
DisplayHeight	The height of the display in pixels.
DisplayOrientation	The current orientation of the device.
DisplayWidth	The width of the display in pixels.
IsEmulator	Whether the connected device is an emulator.
Model	The device name of the connected device.
OperatingSystem	the operating system of the mobile device, Android or iOS
OsVersion	The version of the operating system of the connected device.
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the device at the specified coordinates. (Inherited from IMobileClickable)
CloseApp	Closes the app and releases the device, to make it available to other users.
DoubleClick	Double-clicks on the device at the specified coordinates. (Inherited from IMobileClickable)
Drag	Performs a drag operation between the two specified points. (Inherited from IMobileGestures)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)

Name	Description
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateConnectionString</i>	Generates a connection string for this mobile device.
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>LongClick</i>	Long-clicks on the device at the specified coordinates. (Inherited from <i>IMobileClickable</i>)
<i>MultiTouch</i>	Performs a multi-touch operation with the given pointers. For every given pointer a swipe operation is executed at the same time. (Inherited from <i>IMobileGestures</i>)

Name	Description
<i>PinchIn</i>	Performs a two-pointer gesture, where each pointer moves toward the other, from the edges to the center of this object. For example to zoom out on an image. (Inherited from <i>IMobileGestures</i>)
<i>PinchOut</i>	Performs a two-pointer gesture, where each pointer moves opposite across the other, from the center out towards the edges of the this object. For example to zoom in on an image. (Inherited from <i>IMobileGestures</i>)
<i>PressBack</i>	Presses the back button. This method is not supported on iOS.
<i>PressDelete</i>	Presses the delete button.
<i>PressEnter</i>	Presses the enter button.
<i>PressHome</i>	Presses the home button.
<i>PressKeyCode</i>	Presses a certain Android-specific key code. This method is not supported on iOS.
<i>PressRecentApps</i>	Presses the recent apps button.
<i>Rotate</i>	Simulates rotating the device screen.
<i>SetLocation</i>	Sets the geographic location of the device, this method only works on Android devices (physical or emulated) and iOS simulators.
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>Sleep</i>	Presses the power button if the screen is on. This method is not supported on iOS.
<i>Swipe</i>	Performs a swipe between the two specified points. (Inherited from <i>IMobileGestures</i>)
<i>SwipeDown</i>	Performs a down-swipe. (Inherited from <i>IMobileGestures</i>)
<i>SwipeLeft</i>	Performs a left-swipe. (Inherited from <i>IMobileGestures</i>)
<i>SwipeRight</i>	Performs a right-swipe. (Inherited from <i>IMobileGestures</i>)
<i>SwipeUp</i>	Performs a up-swipe. (Inherited from <i>IMobileGestures</i>)
<i>SwipeWithSegments</i>	Performs a swipe between the specified points. (Inherited from <i>IMobileGestures</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>TwoPointerMultiTouch</i>	Performs a multi-touch operation with two pointers. It executes two swipe operation at the same time. (Inherited from <i>IMobileGestures</i>)

Name	Description
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IMobileKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WakeUp	Presses the power button if the screen is off. This method is not supported on iOS.

MobileObject Class

Description

The base class for all mobile objects.

Inheritance Hierarchy

- [TestObject](#)
 - MobileObject
 - [MobileButton](#)
 - [MobileTextField](#)
 - [MobileWindow](#)

Syntax

```
'Declaration
Public Class MobileObject _
Inherits TestObject _
Implements IMobileClickable, IMobileGestures, IMobileKeyable
```

Properties

Name	Description
IsEnabled	Whether the mobile object is enabled.
IsFocused	Whether the mobile object has focus. This property is not supported on iOS.
IsSelected	Whether the mobile object is selected or checked.
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the device at the specified coordinates. (Inherited from IMobileClickable)
DoubleClick	Double-clicks on the device at the specified coordinates. (Inherited from IMobileClickable)
Drag	Performs a drag operation between the two specified points. (Inherited from IMobileGestures)
DragTo	Drags this object to the specified point relative to the mobile device.
DragToObject	Drags this object to the specified destination object.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the

Name	Description
	agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)

<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>LongClick</i>	Long-clicks on the device at the specified coordinates. (Inherited from <i>IMobileClickable</i>)

Name	Description
MultiTouch	Performs a multi-touch operation with the given pointers. For every given pointer a swipe operation is executed at the same time. (Inherited from IMobileGestures)
PinchIn	Performs a two-pointer gesture, where each pointer moves toward the other, from the edges to the center of this object. For example to zoom out on an image. (Inherited from IMobileGestures)
PinchOut	Performs a two-pointer gesture, where each pointer moves opposite across the other, from the center out towards the edges of the this object. For example to zoom in on an image. (Inherited from IMobileGestures)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
Swipe	Performs a swipe between the two specified points. (Inherited from IMobileGestures)
SwipeDown	Performs a down-swipe. (Inherited from IMobileGestures)
SwipeLeft	Performs a left-swipe. (Inherited from IMobileGestures)
SwipeRight	Performs a right-swipe. (Inherited from IMobileGestures)
SwipeUp	Performs a up-swipe. (Inherited from IMobileGestures)
SwipeWithSegments	Performs a swipe between the specified points. (Inherited from IMobileGestures)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TwoPointerMultiTouch	Performs a multi-touch operation with two pointers. It executes two swipe operation at the same time. (Inherited from IMobileGestures)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IMobileKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForObject	Waits for an object that matches the specified locator. If no object matches within a timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

MobileTextField Class

Description

Represents a text field.

Inheritance Hierarchy

- [MobileObject](#)
 - MobileTextField

Syntax

```
'Declaration
Public Class MobileTextField _
Inherits MobileObject
```

Properties

Name	Description
<i>IsEnabled</i>	Whether the mobile object is enabled. (Inherited from <i>MobileObject</i>)
<i>IsFocused</i>	Whether the mobile object has focus. This property is not supported on iOS. (Inherited from <i>MobileObject</i>)
<i>IsSelected</i>	Whether the mobile object is selected or checked. (Inherited from <i>MobileObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>ClearText</i>	Clears all the content from the text field.
<i>Click</i>	Clicks on the device at the specified coordinates. (Inherited from <i>IMobileClickable</i>)
<i>DoubleClick</i>	Double-clicks on the device at the specified coordinates. (Inherited from <i>IMobileClickable</i>)
<i>Drag</i>	Performs a drag operation between the two specified points. (Inherited from <i>IMobileGestures</i>)
<i>DragTo</i>	Drags this object to the specified point relative to the mobile device. (Inherited from <i>MobileObject</i>)
<i>DragToObject</i>	Drags this object to the specified destination object. (Inherited from <i>MobileObject</i>)
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)

Name	Description
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
LongClick	Long-clicks on the device at the specified coordinates. (Inherited from IMobileClickable)
MultiTouch	Performs a multi-touch operation with the given pointers. For every given pointer a swipe operation is executed at the same time. (Inherited from IMobileGestures)
PinchIn	Performs a two-pointer gesture, where each pointer moves toward the other, from the edges to the center of this object. For example to zoom out on an image. (Inherited from IMobileGestures)
PinchOut	Performs a two-pointer gesture, where each pointer moves opposite across the other, from the center out towards the edges of the this object. For example to zoom in on an image. (Inherited from IMobileGestures)

Name	Description
<i>setProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>setText</i>	Substitutes new text for the text in the text field.
<i>swipe</i>	Performs a swipe between the two specified points. (Inherited from <i>IMobileGestures</i>)
<i>swipeDown</i>	Performs a down-swipe. (Inherited from <i>IMobileGestures</i>)
<i>swipeLeft</i>	Performs a left-swipe. (Inherited from <i>IMobileGestures</i>)
<i>swipeRight</i>	Performs a right-swipe. (Inherited from <i>IMobileGestures</i>)
<i>swipeUp</i>	Performs a up-swipe. (Inherited from <i>IMobileGestures</i>)
<i>swipeWithSegments</i>	Performs a swipe between the specified points. (Inherited from <i>IMobileGestures</i>)
<i>textCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>textClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>textExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>textRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>twoPointerMultiTouch</i>	Performs a multi-touch operation with two pointers. It executes two swipe operation at the same time. (Inherited from <i>IMobileGestures</i>)
<i>typeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IMobileKeyable</i>)
<i>typePasswordKeys</i>	Types an encrypted password into a text field.
<i>waitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>waitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>waitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>waitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>waitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider

Name	Description
<i>WaitForObject</i>	increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

MobileWindow Class

Description

The mobile window.

Inheritance Hierarchy

- [*MobileObject*](#)
 - MobileWindow

Syntax

```
'Declaration
Public Class MobileWindow _
Inherits MobileObject
```

Properties

Name	Description
<i>IsEnabled</i>	Whether the mobile object is enabled. (Inherited from <i>MobileObject</i>)
<i>IsFocused</i>	Whether the mobile object has focus. This property is not supported on iOS. (Inherited from <i>MobileObject</i>)
<i>IsSelected</i>	Whether the mobile object is selected or checked. (Inherited from <i>MobileObject</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)

Name	Description
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the device at the specified coordinates. (Inherited from IMobileClickable)
DoubleClick	Double-clicks on the device at the specified coordinates. (Inherited from IMobileClickable)
Drag	Performs a drag operation between the two specified points. (Inherited from IMobileGestures)
DragTo	Drags this object to the specified point relative to the mobile device. (Inherited from MobileObject)
DragToObject	Drags this object to the specified destination object. (Inherited from MobileObject)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)

Name	Description
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>LongClick</i>	Long-clicks on the device at the specified coordinates. (Inherited from <i>IMobileClickable</i>)
<i>MultiTouch</i>	Performs a multi-touch operation with the given pointers. For every given pointer a swipe operation is executed at the same time. (Inherited from <i>IMobileGestures</i>)
<i>PinchIn</i>	Performs a two-pointer gesture, where each pointer moves toward the other, from the edges to the center of this object. For example to zoom out on an image. (Inherited from <i>IMobileGestures</i>)
<i>PinchOut</i>	Performs a two-pointer gesture, where each pointer moves opposite across the other, from the center out towards the edges of the this object. For example to zoom in on an image. (Inherited from <i>IMobileGestures</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>Swipe</i>	Performs a swipe between the two specified points. (Inherited from <i>IMobileGestures</i>)
<i>SwipeDown</i>	Performs a down-swipe. (Inherited from <i>IMobileGestures</i>)
<i>SwipeLeft</i>	Performs a left-swipe. (Inherited from <i>IMobileGestures</i>)
<i>SwipeRight</i>	Performs a right-swipe. (Inherited from <i>IMobileGestures</i>)
<i>SwipeUp</i>	Performs a up-swipe. (Inherited from <i>IMobileGestures</i>)

Name	Description
<i>SwipeWithSegments</i>	Performs a swipe between the specified points. (Inherited from <i>IMobileGestures</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>TwoPointerMultiTouch</i>	Performs a multi-touch operation with two pointers. It executes two swipe operation at the same time. (Inherited from <i>IMobileGestures</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IMobileKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

Name	Description
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Rumba Class Reference

Lists the available classes for testing Rumba controls.

Rumba Keys

Description

Contains the string constants for the Rumba key mnemonics which can be used in the `SendKeys` and `SynchSendKeys` methods of the `RumbaObject` class.

Includes the following string constants:

String Constant	Key Mnemonic
<code>At</code>	<code>@@</code>
<code>Alt</code>	<code>@A</code>
<code>AltCursor</code>	<code>@e@1*</code>
<code>Attention</code>	<code>@A@Q</code>
<code>Backspace</code>	<code>@B</code>
<code>Backtab</code>	<code>@B</code>
<code>Clear</code>	<code>@C</code>
<code>Cmd</code>	<code>@A@Y</code>
<code>CursorDown</code>	<code>@V</code>
<code>CursorLeft</code>	<code>@L</code>
<code>CursorRight</code>	<code>@Z</code>
<code>CursorSelect</code>	<code>@e@1*</code>
<code>CursorUp</code>	<code>@U</code>
<code>Delete</code>	<code>@D</code>
<code>Dup</code>	<code>@S@x</code>
<code>End</code>	<code>@q</code>
<code>Enter</code>	<code>@E</code>
<code>EraseEof</code>	<code>@F</code>
<code>EraseEol</code>	<code>@e@d</code>
<code>EraseInput</code>	<code>@A@F</code>

RumbaCharacterAttribute Data Type

Represents the character attributes of an on-screen character.

Can include the following character attributes:

Attribute	Description
<code>backgroundColor</code>	The background color of the character.
<code>foregroundColor</code>	The foreground color of the character.
<code>column</code>	The column of the character on the screen.
<code>line</code>	The line of the character on the screen.
<code>autoEnter</code>	Defines if the character is part of an auto-enter text.
<code>autoSkip</code>	Defines if the character is part of an auto-skip text.
<code>blinking</code>	Defines if the character is blinking.
<code>bold</code>	Defines if the character is bold.
<code>columnSeparator</code>	Defines if the character is a column separator.
<code>detectable</code>	Defines if the character is part of a detectable text.
<code>hidden</code>	Defines if the character is part of a hidden text.
<code>protect</code>	Defines if the character is part of a protected text.
<code>reverseVideo</code>	Defines if the character is displayed in reverse video.
<code>underlined</code>	Defines if the character is underlined.

For additional information, see *IRDEAttribute Properties* in the Rumba Developer Edition (RDE) documentation.

RumbaField Class

Description

Represents a field on the green screen.

Inheritance Hierarchy

- [RumbaObject](#)
 - RumbaField
 - [RumbaLabel](#)
 - [RumbaTextField](#)

Syntax

```
'Declaration  
Public Class RumbaField _  
Inherits RumbaObject
```

Properties

Name	Description
AutoEnter	A value that indicates true if the field is an AutoEnter field.
AutoSkip	A value that is true if the field is an AutoSkip field.
Detectable	A value is indicates true if the field is detectable.
Dup	A value that indicates true if the field is a dup field.
EndColumn	A value that indicates the ending column of the field.
EndLine	A value that indicates the ending line of the field.
EndPosition	The 1-based end position of the field, when the screen is seen as one sequence of characters.
Enptui	A value that indicates true if the field is an ENPTUI field.
FieldExitRequired	A value that indicates true if the field is required before exiting the screen.
Hidden	A value that indicates if the field is hidden.
Intense	A value that indicates true if the field is intense.
Length	The length of the field.
ModifiedDataTag	A value that indicates true if the field has the ModifiedDataTag property set.
Protected	A value that indicates true if the field is protected (i.e. a RumbaLabel).
StartColumn	A value that indicates the column in which the field begins.
StartLine	A value that indicates the line in which the field begins.
StartPosition	The 1-based start position of the field, when the screen is seen as one sequence of characters.
Text	The text of the control. (Inherited from TestObject)
Type	A value that represents the input allowed for this field.
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)

Name	Description
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetCharacterAttributes	Gets the character attributes for this field's characters.
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)

Name	Description
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>SendKeys</i>	Sends keys. Supports RDE mnemonics. (Inherited from <i>RumbaObject</i>)
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>SynchSendKeys</i>	Synchronously sends keys. Supports RDE mnemonics. (Inherited from <i>RumbaObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

Name	Description
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

RumbaLabel Class

Description

A field in the screen whose text can be only be retrieved but not set.

Inheritance Hierarchy

- [RumbaField](#)
 - RumbaLabel

Syntax

```
'Declaration
Public Class RumbaLabel _
Inherits RumbaField
```

Properties

Name	Description
<i>AutoEnter</i>	A value that indicates true if the field is an AutoEnter field. (Inherited from <i>RumbaField</i>)
<i>AutoSkip</i>	A value that is true if the field is an AutoSkip field. (Inherited from <i>RumbaField</i>)
<i>Detectable</i>	A value is indicates true if the field is detectable. (Inherited from <i>RumbaField</i>)
<i>Dup</i>	A value that indicates true if the field is a dup field. (Inherited from <i>RumbaField</i>)
<i>EndColumn</i>	A value that indicates the ending column of the field. (Inherited from <i>RumbaField</i>)
<i>EndLine</i>	A value that indicates the ending line of the field. (Inherited from <i>RumbaField</i>)
<i>EndPosition</i>	The 1-based end position of the field, when the screen is seen as one sequence of characters. (Inherited from <i>RumbaField</i>)
<i>Enptui</i>	A value that indicates true if the field is an ENPTUI field. (Inherited from <i>RumbaField</i>)
<i>FieldExitRequired</i>	A value that indicates true if the field is required before exiting the screen. (Inherited from <i>RumbaField</i>)
<i>Hidden</i>	A value that indicates if the field is hidden. (Inherited from <i>RumbaField</i>)
<i>Intense</i>	A value that indicates true if the field is intense. (Inherited from <i>RumbaField</i>)
<i>Length</i>	The length of the field. (Inherited from <i>RumbaField</i>)
<i>ModifiedDataTag</i>	A value that indicates true if the field has the ModifiedDataTag property set. (Inherited from <i>RumbaField</i>)
<i>Protected</i>	A value that indicates true if the field is protected (i.e. a RumbaLabel). (Inherited from <i>RumbaField</i>)
<i>StartColumn</i>	A value that indicates the column in which the field begins. (Inherited from <i>RumbaField</i>)
<i>StartLine</i>	A value that indicates the line in which the field begins. (Inherited from <i>RumbaField</i>)
<i>StartPosition</i>	The 1-based start position of the field, when the screen is seen as one sequence of characters. (Inherited from <i>RumbaField</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>Type</i>	A value that represents the input allowed for this field. (Inherited from <i>RumbaField</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetCharacterAttributes	Gets the character attributes for this field's characters. (Inherited from RumbaField)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)

Name	Description
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SendKeys	Sends keys. Supports RDE mnemonics. (Inherited from RumbaObject)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
SynchSendKeys	Synchronously sends keys. Supports RDE mnemonics. (Inherited from RumbaObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)

Name	Description
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

RumbaObject Class

Description

RumbaObject.

Inheritance Hierarchy

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

RumbaScreen Class

Description

Represents the whole green screen.

Inheritance Hierarchy

- [RumbaObject](#)
 - RumbaScreen

Syntax

```
'Declaration
Public Class RumbaScreen _
Inherits RumbaObject
```

Properties

Name	Description
BackgroundColor	the background color of the display control.
CharacterSetId	a value that identifies the character set translation table used by the Display control.
ColumnCount	a value that indicates the number of columns on the current screen.
CursorColumn	the column position of the cursor on the screen.
CursorLine	the line position of the cursor on the screen.
CursorPosition	The current cursor position on the screen. Values are starting with 1 for the first line or column.
HostConnected	a value that indicates if the host is connected.
HostDeviceName	the host device name.
HostIpAddress	the host IP address.
KeyboardLocked	a value that indicates whether keyboard input is inhibited.
LineCount	a value that indicates the number of lines on the current screen.
ScreenId	the screen id.
ScreenSize	the size of the screen in text lines and columns.
SessionName	the session name.
SupportsStructuredFields	a value that indicates if the host supports structured field decoding.
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
Clear	Clears the screen by sending the "clear" key. Equivalent to <code>synchSendKeys(RumbaKey.CLEAR)</code> .
Click	Clicks on the object. (Inherited from IClickable)
Connect	Connects to the hosts in the current configuration.
Disconnect	Disconnects the current connection.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetCharacterAttributes	Gets the character attributes for length-number of characters starting at the given position.
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetContent	Retrieves a string containing the screen without line breaks starting at the specified text position.
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject . (Inherited from TestObject)
GetLines	Retrieves a clipping of the screen and returns the selected lines in a list of strings.
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)

Name	Description
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>Reset</i>	Resets the screen by sending the "reset" key. Equivalent to <code>synchSendKeys(RumbaKey.RESET)</code> .
<i>SendKeys</i>	Sends keys. Supports RDE mnemonics. (Inherited from <i>RumbaObject</i>)
<i>SetCursorPosition</i>	Moves the cursor to the given position of the screen.
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)

Name	Description
Submit	Submits the entered data to the server by sending the "submit" key. Equivalent to <code>synchSendKeys(RumbaKey.SUBMIT)</code> .
SynchSendKeys	Synchronously sends keys. Supports RDE mnemonics. (Inherited from RumbaObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForHostConnected	Waits until the session is connected.
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used.

Name	Description
	An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WriteText	Writes text on the screen.

RumbaTextField Class

Description

A field in the screen whose text can be both retrieved and set.

Inheritance Hierarchy

- [RumbaField](#)
 - RumbaTextField

Syntax

```
'Declaration
Public Class RumbaTextField _
Inherits RumbaField
```

Properties

Name	Description
AutoEnter	A value that indicates true if the field is an AutoEnter field. (Inherited from RumbaField)
AutoSkip	A value that is true if the field is an AutoSkip field. (Inherited from RumbaField)
Detectable	A value is indicates true if the field is detectable. (Inherited from RumbaField)
Dup	A value that indicates true if the field is a dup field. (Inherited from RumbaField)
EndColumn	A value that indicates the ending column of the field. (Inherited from RumbaField)
EndLine	A value that indicates the ending line of the field. (Inherited from RumbaField)
EndPosition	The 1-based end position of the field, when the screen is seen as one sequence of characters. (Inherited from RumbaField)
Enptui	A value that indicates true if the field is an ENPTUI field. (Inherited from RumbaField)

Name	Description
FieldExitRequired	A value that indicates true if the field is required before exiting the screen. (Inherited from RumbaField)
Hidden	A value that indicates if the field is hidden. (Inherited from RumbaField)
Intense	A value that indicates true if the field is intense. (Inherited from RumbaField)
Length	The length of the field. (Inherited from RumbaField)
ModifiedDataTag	A value that indicates true if the field has the ModifiedDataTag property set. (Inherited from RumbaField)
Protected	A value that indicates true if the field is protected (i.e. a RumbaLabel). (Inherited from RumbaField)
StartColumn	A value that indicates the column in which the field begins. (Inherited from RumbaField)
StartLine	A value that indicates the line in which the field begins. (Inherited from RumbaField)
StartPosition	The 1-based start position of the field, when the screen is seen as one sequence of characters. (Inherited from RumbaField)
Text	The text of the control. (Inherited from TestObject)
Type	A value that represents the input allowed for this field. (Inherited from RumbaField)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)

Name	Description
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetCharacterAttributes	Gets the character attributes for this field's characters. (Inherited from RumbaField)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)

Name	Description
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SendKeys	Sends keys. Supports RDE mnemonics. (Inherited from RumbaObject)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
SetText	Sets the text field's text.
SynchSendKeys	Synchronously sends keys. Supports RDE mnemonics. (Inherited from RumbaObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a

Name	Description
<i>WaitForObject</i>	WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

SAP Class Reference

Lists the available classes for testing SAP controls.

ISapContextMenuable Interface

Description

Interface for any Component which supports ContextMenu selections.

Syntax

```
'Declaration
Public Class ISapContextMenuable
```

Methods

Name	Description
<i>SelectContextMenuItem</i>	Select an item from the controls context menu.
<i>SelectContextMenuItemByPosition</i>	This method allows you to select a context menu item using the position of the item.
<i>SelectContextMenuItemByText</i>	Select a menu item of a context menu using the text of the item and possible higher level menus.

SapBarChart Class

Description

Class for SAP Bar Chart.

Inheritance Hierarchy

- [SapShell](#)
 - SapBarChart

Syntax

```
'Declaration  
Public Class SapBarChart _  
Inherits SapShell _  
Implements ISapContextMenuable
```

Properties

Name	Description
AccessibilityDescription	the accessibility description of the shell.
AccessibilityText	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from SapComponent)
Changeable	whether an object is changeable. (Inherited from SapComponent)
ChartCount	the number of charts.
CurrentContextMenu	The current context menu. This is only set when a context menu is available at the shell object.
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from SapComponent)
DragDropSupported	whether the shell allows drag and drop operations. (Inherited from SapShell)
Height	the current height of the component. (Inherited from SapComponent)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from SapComponent)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from SapComponent)
Left	the left position of the element in screen coordinates. (Inherited from SapComponent)

Name	Description
<i>Modified</i>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <i>SapComponent</i>)
<i>Name</i>	the name of the component. (Inherited from <i>SapComponent</i>)
<i>ScreenLeft</i>	the left position of the component in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>ScreenTop</i>	the top position of the component in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>Tooltip</i>	the tooltip text. (Inherited from <i>SapComponent</i>)
<i>Top</i>	the top coordinate of the element in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>Width</i>	the current width of the component. (Inherited from <i>SapComponent</i>)
<i>WindowHandle</i>	the window handle of the control that is connected to the GuiShell.

Methods

Name	Description
<i>BarCount</i>	Returns the number of bars in the given chart.
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetBarContent</i>	Returns the content of the bar.

Name	Description
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>GetGridLineContent</i>	Returns the content of the grid line.
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>GridCount</i>	Returns the number of grids within the chart.
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>LinkCount</i>	Returns the number of links within the given chart.
<i>SelectContextMenuItem</i>	Select an item from the controls context menu. (Inherited from <i>ISapContextMenuable</i>)
<i>SelectContextMenuItemByPosition</i>	This method allows you to select a context menu item using the position of the item. (Inherited from <i>ISapContextMenuable</i>)
<i>SelectContextMenuItemByText</i>	Select a menu item of a context menu using the text of the item and possible higher level menus. (Inherited from <i>ISapContextMenuable</i>)
<i>SendData</i>	Send data to the server.

Name	Description
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
ShowContextMenu	Shows the context menu of the control. (Inherited from SapComponent)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If

Name	Description
	you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SapBox Class

Description

Class for SAP SapBox.

Inheritance Hierarchy

- [SapComponent](#)
 - SapBox

Syntax

```
'Declaration
Public Class SapBox _
Inherits SapComponent
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from SapComponent)
Changeable	whether an object is changeable. (Inherited from SapComponent)
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from SapComponent)
Height	the current height of the component. (Inherited from SapComponent)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from SapComponent)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from SapComponent)
Left	the left position of the element in screen coordinates. (Inherited from SapComponent)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from SapComponent)

Name	Description
<i>Name</i>	the name of the component. (Inherited from <i>SapComponent</i>)
<i>ScreenLeft</i>	the left position of the component in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>ScreenTop</i>	the top position of the component in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>Tooltip</i>	the tooltip text. (Inherited from <i>SapComponent</i>)
<i>Top</i>	the top coordinate of the element in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>Width</i>	the current width of the component. (Inherited from <i>SapComponent</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <i>TestObject</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)

Name	Description
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>ShowContextMenu</i>	Shows the context menu of the control. (Inherited from <i>SapComponent</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

Name	Description
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. <i>Modified</i>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <i>SapComponent</i>)
<i>Name</i>	the name of the component. (Inherited from <i>SapComponent</i>)
<i>ScreenLeft</i>	the left position of the component in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>ScreenTop</i>	the top position of the component in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>Tooltip</i>	the tooltip text. (Inherited from <i>SapComponent</i>)
<i>Top</i>	the top coordinate of the element in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>Width</i>	the current width of the component. (Inherited from <i>SapComponent</i>)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this <code>TestObject</code> . (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)

Name	Description
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
Select	This emulates manually pressing a button. Pressing a button will always cause server communication to occur, rendering all references to elements below the window level invalid.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
ShowContextMenu	Shows the context menu of the control. (Inherited from SapComponent)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider

Name	Description
WaitForObject	increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SapCalendar Class

Description

SapCalendar class represents a SapCalendar.

Inheritance Hierarchy

- [SapShell](#)
 - SapCalendar

Syntax

```
'Declaration
Public Class SapCalendar _
Inherits SapShell _
Implements ISapContextMenuable
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from SapComponent)
Changeable	whether an object is changeable. (Inherited from SapComponent)

Name	Description
CurrentContextMenu	The current context menu. This is only set when a context menu is available at the shell object.
Day	The day of the month that is currently selected.
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from SapComponent)
DragDropSupported	whether the shell allows drag and drop operations. (Inherited from SapShell)
EndSelection	The end of the selection interval.
FirstVisibleDate	the earliest date visible in the calendar control.
Height	the current height of the component. (Inherited from SapComponent)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from SapComponent)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from SapComponent)
LastVisibleDate	the last date visible in the calendar control.
Left	the left position of the element in screen coordinates. (Inherited from SapComponent)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from SapComponent)
Month	The month of the year that is currently selected.
Name	the name of the component. (Inherited from SapComponent)
ScreenLeft	the left position of the component in screen coordinates. (Inherited from SapComponent)
ScreenTop	the top position of the component in screen coordinates. (Inherited from SapComponent)
SelectionInterval	The interval that is currently selected.
StartSelection	The start of the selection interval.
Text	The text of the control. (Inherited from TestObject)
Tooltip	the tooltip text. (Inherited from SapComponent)
Top	the top coordinate of the element in screen coordinates. (Inherited from SapComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Week	The week of the year that is currently selected.
Width	the current width of the component. (Inherited from SapComponent)
Year	The year that is currently selected.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ContextMenu	Opens a context menu.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)

FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject . (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)

Name	Description
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
SelectContextMenuItem	Select an item from the controls context menu. (Inherited from ISapContextMenuable)
SelectContextMenuItemByPosition	This method allows you to select a context menu item using the position of the item. (Inherited from ISapContextMenuable)
SelectContextMenuItemByText	Select a menu item of a context menu using the text of the item and possible higher level menus. (Inherited from ISapContextMenuable)
SetFirstVisibleDate	Sets the earliest date visible in the calendar control.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetFocusDate	Sets the date to be focused.
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
SetSelectionInterval	Selects the specified interval.
ShowContextMenu	Shows the context menu of the control. (Inherited from SapComponent)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForObject	Waits for an object that matches the specified locator. If no object matches within a timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SapChart Class

Description

Class for SAP Chart.

Inheritance Hierarchy

- [SapShell](#)
 - SapChart

Syntax

```
'Declaration
Public Class SapChart _
Inherits SapShell _
Implements ISapContextMenuable
```

Properties

Name	Description
AccessibilityDescription	the accessibility description of the shell.

Name	Description
<i>AccessibilityText</i>	an additional text for accessibility support. (Inherited from <i>SapComponent</i>)
<i>AccessibilityTextOnRequest</i>	an additional text for accessibility support. (Inherited from <i>SapComponent</i>)
<i>AccessibilityTooltip</i>	an additional tooltip text for accessibility support. (Inherited from <i>SapComponent</i>)
<i>Changeable</i>	whether an object is changeable. (Inherited from <i>SapComponent</i>)
<i>CurrentContextMenu</i>	The current context menu. This is only set when a context menu is available at the shell object.
<i>DefaultTooltip</i>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <i>SapComponent</i>)
<i>DragDropSupported</i>	whether the shell allows drag and drop operations. (Inherited from <i>SapShell</i>)
<i>Height</i>	the current height of the component. (Inherited from <i>SapComponent</i>)
<i>IconName</i>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <i>SapComponent</i>)
<i>IsSymbolFont</i>	whether the component's text is visualized in the SAP symbol font. (Inherited from <i>SapComponent</i>)
<i>Left</i>	the left position of the element in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>Modified</i>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <i>SapComponent</i>)
<i>Name</i>	the name of the component. (Inherited from <i>SapComponent</i>)
<i>ScreenLeft</i>	the left position of the component in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>ScreenTop</i>	the top position of the component in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>Tooltip</i>	the tooltip text. (Inherited from <i>SapComponent</i>)
<i>Top</i>	the top coordinate of the element in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>Width</i>	the current width of the component. (Inherited from <i>SapComponent</i>)
<i>WindowHandle</i>	the window handle of the control that is connected to the GuiShell.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this <code>TestObject</code> . (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)

Name	Description
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
SelectContextMenuItem	Select an item from the controls context menu. (Inherited from ISapContextMenuable)
SelectContextMenuItemByPosition	This method allows you to select a context menu item using the position of the item. (Inherited from ISapContextMenuable)
SelectContextMenuItemByText	Select a menu item of a context menu using the text of the item and possible higher level menus. (Inherited from ISapContextMenuable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
ShowContextMenu	Shows the context menu of the control. (Inherited from SapComponent)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
ValueChange	Changes a value of the chart.
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by

Name	Description
	setting the value of the option <i>OPT_WAIT_RESOLVE_OBJDEF</i> . Use <i>WaitForObject</i> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <i>WaitForObject</i> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <i>WaitForObject</i> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <i>OPT_WAIT_RESOLVE_OBJDEF</i> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <i>OPT_WAIT_RESOLVE_OBJDEF</i> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <i>OPT_WAIT_RESOLVE_OBJDEF</i> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

SapCheckBox Class

Description

SapCheckBox class is the class for check box controls.

Inheritance Hierarchy

- *SapComponent*
 - SapCheckBox

Syntax

```
'Declaration
Public Class SapCheckBox _
Inherits SapComponent
```

Properties

Name	Description
<i>AccessibilityText</i>	an additional text for accessibility support. (Inherited from <i>SapComponent</i>)
<i>AccessibilityTextOnRequest</i>	an additional text for accessibility support. (Inherited from <i>SapComponent</i>)

Name	Description
<i>AccessibilityTooltip</i>	an additional tooltip text for accessibility support. (Inherited from <i>SapComponent</i>)
<i>Changeable</i>	whether an object is changeable. (Inherited from <i>SapComponent</i>)
<i>CharHeight</i>	the height of the element in character metric.
<i>CharLeft</i>	the left coordinate of the element in character metric.
<i>CharTop</i>	the top coordinate of the element in character metric.
<i>CharWidth</i>	the width of the element in character metric.
<i>Checked</i>	whether the checkbox is checked.
<i>ColorIndex</i>	the index of the list color of this element.
<i>ColorIntensified</i>	whether the Intensified flag is set in screen painter for this element.
<i>ColorInverse</i>	whether the inverse color style is set in screen painter for the element.
<i>DefaultTooltip</i>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <i>SapComponent</i>)
<i>Flushing</i>	whether the value change causes a round trip.
<i>Height</i>	the current height of the component. (Inherited from <i>SapComponent</i>)
<i>IconName</i>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <i>SapComponent</i>)
<i>IsLeftLabel</i>	whether the component has the 'assign left' flag.
<i>IsListElement</i>	whether the element is on an ABAP list, not a screen.
<i>IsRightLabel</i>	whether the component has the 'assign right' flag.
<i>IsSymbolFont</i>	whether the component's text is visualized in the SAP symbol font. (Inherited from <i>SapComponent</i>)
<i>Left</i>	the left position of the element in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>Modified</i>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <i>SapComponent</i>)
<i>Name</i>	the name of the component. (Inherited from <i>SapComponent</i>)
<i>RowText</i>	the text of the while line containing the current component.
<i>ScreenLeft</i>	the left position of the component in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>ScreenTop</i>	the top position of the component in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>Tooltip</i>	the tooltip text. (Inherited from <i>SapComponent</i>)

Name	Description
Top	the top coordinate of the element in screen coordinates. (Inherited from SapComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	the current width of the component. (Inherited from SapComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Check	Checks the check box.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)

Name	Description
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
ShowContextMenu	Shows the context menu of the control. (Inherited from SapComponent)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
Uncheck	Un-checks the check box.
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown.

Name	Description
	The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SapColorSelector Class

Description

SapColorSelector class represents a SapColorSelector.

Inheritance Hierarchy

- [SapShell](#)
 - SapColorSelector

Syntax

```
'Declaration
Public Class SapColorSelector _
Inherits SapShell _
Implements ISapContextMenuable
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from SapComponent)

Name	Description
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from SapComponent)
Changeable	whether an object is changeable. (Inherited from SapComponent)
CurrentContextMenu	The current context menu. This is only set when a context menu is available at the shell object.
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from SapComponent)
DragDropSupported	whether the shell allows drag and drop operations. (Inherited from SapShell)
Height	the current height of the component. (Inherited from SapComponent)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from SapComponent)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from SapComponent)
Left	the left position of the element in screen coordinates. (Inherited from SapComponent)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from SapComponent)
Name	the name of the component. (Inherited from SapComponent)
ScreenLeft	the left position of the component in screen coordinates. (Inherited from SapComponent)
ScreenTop	the top position of the component in screen coordinates. (Inherited from SapComponent)
Text	The text of the control. (Inherited from TestObject)
Tooltip	the tooltip text. (Inherited from SapComponent)
Top	the top coordinate of the element in screen coordinates. (Inherited from SapComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	the current width of the component. (Inherited from SapComponent)

Methods

Name	Description

Name	Description
WaitForObject	WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SapComboBox Class

Description

Class for SAP ComboBox.

Inheritance Hierarchy

- [SapComponent](#)
 - SapComboBox

Syntax

```
'Declaration
Public Class SapComboBox _
Inherits SapComponent
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from SapComponent)
Changeable	whether an object is changeable. (Inherited from SapComponent)

Name	Description
<i>CharHeight</i>	the height of the element in character metric.
<i>CharLeft</i>	the left coordinate of the element in character metric.
<i>CharTop</i>	the top coordinate of the element in character metric.
<i>CharWidth</i>	the width of the element in character metric.
<i>DefaultTooltip</i>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <i>SapComponent</i>)
<i>Flushing</i>	whether the value change causes a round trip.
<i>Height</i>	the current height of the component. (Inherited from <i>SapComponent</i>)
<i>IconName</i>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <i>SapComponent</i>)
<i>IsLeftLabel</i>	whether the component has the 'assign left' flag.
<i>IsListBoxActive</i>	whether the list box of the the combo box is currently open.
<i>IsRightLabel</i>	whether the component has the 'assign right' flag.
<i>IsSymbolFont</i>	whether the component's text is visualized in the SAP symbol font. (Inherited from <i>SapComponent</i>)
<i>Key</i>	the key of the currently selected item.
<i>Left</i>	the left position of the element in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>Modified</i>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <i>SapComponent</i>)
<i>Name</i>	the name of the component. (Inherited from <i>SapComponent</i>)
<i>Required</i>	whether the component is a required value for the screen.
<i>ScreenLeft</i>	the left position of the component in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>ScreenTop</i>	the top position of the component in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>Tooltip</i>	the tooltip text. (Inherited from <i>SapComponent</i>)
<i>Top</i>	the top coordinate of the element in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>Width</i>	the current width of the component. (Inherited from <i>SapComponent</i>)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetCurrentEntryKey	the key of the current entry.
GetCurrentEntryValue	the value of the current entry.
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetEntryKeys	a list of all entry keys.
GetEntryValues	a list of all entry values.
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)

Name	Description
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>SelectItem</i>	Selects the specified item.
<i>SelectKey</i>	Selects the list item with the specified key.
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>ShowContextMenu</i>	Shows the context menu of the control. (Inherited from <i>SapComponent</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <i>WaitForObject</i> if the AUT takes a long time to display a specific object,

Name	Description
	for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SapComponent Class

Description

SapComponent class is the base class for SAP.

Syntax

```
'Declaration
Public Class SapComponent _
Inherits TestObject _
Implements IFocusable
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support.
AccessibilityTextOnRequest	an additional text for accessibility support.
AccessibilityTooltip	an additional tooltip text for accessibility support.
Changeable	whether an object is changeable.
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type.
Height	the current height of the component.
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string.
IsSymbolFont	whether the component's text is visualized in the SAP symbol font.
Left	the left position of the element in screen coordinates.
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system.
Name	the name of the component.
ScreenLeft	the left position of the component in screen coordinates.
ScreenTop	the top position of the component in screen coordinates.
Text	The text of the control. (Inherited from TestObject)
Tooltip	the tooltip text.
Top	the top coordinate of the element in screen coordinates.
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Name	Description
<i>Width</i>	the current width of the component.

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)

Name	Description
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>ShowContextMenu</i>	Shows the context menu of the control.
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. SapContextMenu Class

Description

The class for SAP context menus.

For information on determining the items of a SAP context menu, see [Determining the item names and item texts of a SapContextMenu](#).

Inheritance Hierarchy

- [SapMenu](#)
 - SapContextMenu

Syntax

```
'Declaration  
Public Class SapContextMenu _  
Inherits SapMenu
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from SapComponent)
Changeable	whether an object is changeable. (Inherited from SapComponent)
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from SapComponent)
Height	the current height of the component. (Inherited from SapComponent)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from SapComponent)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from SapComponent)
Left	the left position of the element in screen coordinates. (Inherited from SapComponent)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from SapComponent)
Name	the name of the component. (Inherited from SapComponent)
ScreenLeft	the left position of the component in screen coordinates. (Inherited from SapComponent)
ScreenTop	the top position of the component in screen coordinates. (Inherited from SapComponent)
Text	The text of the control. (Inherited from TestObject)
Tooltip	the tooltip text. (Inherited from SapComponent)
Top	the top coordinate of the element in screen coordinates. (Inherited from SapComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	the current width of the component. (Inherited from SapComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this <code>TestObject</code> . (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)

Name	Description
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>Select</i>	Select the menu. (Inherited from <i>SapMenu</i>)
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>ShowContextMenu</i>	Shows the context menu of the control. (Inherited from <i>SapComponent</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)

Name	Description
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SapCustomControl Class

Description

Class for SAP CustomControl.

Inheritance Hierarchy

- [SapComponent](#)
 - SapCustomControl

Syntax

```
'Declaration
Public Class SapCustomControl _
Inherits SapComponent

(Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)

Name	Description
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
ShowContextMenu	Shows the context menu of the control. (Inherited from SapComponent)

Name	Description
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SapDockShell Class

Description

Class for SAP DockShell.

Inheritance Hierarchy

- [SapComponent](#)

An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SapGridView Class

Description

Class for SAP GridView. Some of the methods that have Get as a prefix require the column as an input parameter of type string. This parameter is different for each individual GridView element. To obtain the value of this parameter, record an action on the desired item and use the parameter that you have recorded.

Inheritance Hierarchy

- [SapShell](#)
 - SapGridView

Syntax

```
'Declaration
Public Class SapGridView _
Inherits SapShell _
Implements ISapContextMenuable
```

Properties

Name	Description
<i>AccessibilityText</i>	an additional text for accessibility support. (Inherited from <i>SapComponent</i>)
<i>AccessibilityTextOnRequest</i>	an additional text for accessibility support. (Inherited from <i>SapComponent</i>)
<i>AccessibilityTooltip</i>	an additional tooltip text for accessibility support. (Inherited from <i>SapComponent</i>)
<i>Changeable</i>	whether an object is changeable. (Inherited from <i>SapComponent</i>)
<i>ColumnCount</i>	the number of columns.
<i>ColumnOrder</i>	a list of strings which contains all the column identifiers in the order in which they are displayed.
<i>CurrentCellColumn</i>	the current column.
<i>CurrentCellRow</i>	the current row.
<i>CurrentContextMenu</i>	The current context menu. This is only set when a context menu is available at the shell object.
<i>DefaultTooltip</i>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <i>SapComponent</i>)
<i>DragDropSupported</i>	whether the shell allows drag and drop operations. (Inherited from <i>SapShell</i>)
<i>FirstVisibleColumn</i>	the first visible column of the scrollable area of the grid view, fixed columns are ignored.
<i>FirstVisibleRow</i>	the index of the first visible row in the grid.
<i>FrozenColumnCount</i>	the number of columns that are excluded from horizontal scrolling.
<i>Height</i>	the current height of the component. (Inherited from <i>SapComponent</i>)
<i>IconName</i>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <i>SapComponent</i>)
<i>IsSymbolFont</i>	whether the component's text is visualized in the SAP symbol font. (Inherited from <i>SapComponent</i>)
<i>Left</i>	the left position of the element in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>Modified</i>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <i>SapComponent</i>)
<i>Name</i>	the name of the component. (Inherited from <i>SapComponent</i>)
<i>RowCount</i>	the number of rows.
<i>ScreenLeft</i>	the left position of the component in screen coordinates. (Inherited from <i>SapComponent</i>)

Name	Description
ScreenTop	the top position of the component in screen coordinates. (Inherited from SapComponent)
SelectedCells	a list of strings that contains the selected cells, each of which has the format "<row>,<column id>".
SelectedColumns	a list of strings of currently selected columns.
SelectedRows	a comma separated list of row index numbers or index ranges, such as "1,4,6-8".
SelectionMode	the selection mode. Possible values are: "RowsAndColumns", "ListboxSingle", "ListboxMultiple", "Free".
Text	The text of the control. (Inherited from TestObject)
Title	the title of the grid control.
ToolbarButtonCount	the number of tool bar buttons (separators included).
Tooltip	the tooltip text. (Inherited from SapComponent)
Top	the top coordinate of the element in screen coordinates. (Inherited from SapComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
VisibleRowCount	the number of visible rows of the grid view.
Width	the current width of the component. (Inherited from SapComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ClearSelection	Removes all row, column and cell selections.
Click	Clicks on the specified cell.
ClickCurrentCell	Clicks the current cell.
ContextMenu	Requests the context menu.
CurrentCellMoved	This function notifies the server that another cell was made the current cell. The function must be called whenever the current cell changes.
DeleteRows	Delete the given rows.
DeselectColumn	Removes the specified column from the list of selected columns.
DoubleClick	Double clicks the specified cell.

Name	Description
DoubleClickCurrentCell	Double clicks on the current cell.
DuplicateRows	Duplicates the given range of rows
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetCellColor	Returns an identifier for the color of the cell.
GetCellHeight	Gets the height of the cell in pixels.
GetCellIcon	Gets the icon string of the specified cell.
GetCellLeft	Gets the left position of the cell.
GetCellMaxLength	Gets the maximum length of the cell in number of bytes.
GetCellState	Gets the state of the specified cell. Possible values are: Normal, Error, Warning, Info.
GetCellTooltip	Gets the tooltip of the specified cell.
GetCellTop	Gets the top position of the specified cell.
GetCellType	Gets the cell type of the specified cell.
GetCellValue	Gets the value of the specified cell.
GetCellWidth	Gets the width of the specified cell.
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetColorInfo	Returns the description for the color of the cell.
GetColumnDataType	Gets the data type of the column.
GetColumnPosition	Gets the position of the specified column.
GetColumnSortType	Gets the sort type of the column. Possible values are: None, Ascending, Descending.
GetColumnTitles	Gets all column titles of the specified column.
GetColumnTooltip	Gets the tool tip text of the specified column.
GetColumnTotalType	Gets the total type of the column. Possible values are: None, Total, Subtotal.
GetDisplayedColumnName	Gets the currently displayed title of the specified column.

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetRowTotalLevel	Gets the level of the row.
GetSymbolInfo	Returns the description for the symbol in the cell.
GetToolBarButtonIcon	Gets the name of the icon of the specified toolbar button.
GetToolBarButtonId	Gets the ID of the specified tool bar button.
GetToolBarButtonText	Gets the text of the specified tool bar button.
GetToolBarButtonTooltip	Gets the tooltip of the specified tool bar button
GetToolBarButtonType	Gets the type of the specified toolbar button. Possible values are: "Button", "ButtonAndMenu", "Menu", "Separator", "Group", "CheckBox".
GetToolBarFocusButton	Gets the position of the current focused tool bar button
HasCellF4Help	Returns true if the specified cell has a value help assigned.
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
InsertRows	Inserts a range of rows
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsCellChangeable	Returns true if the specified cell is changeable.

Name	Description
<i>IsCellCheckBoxChecked</i>	Returns true if the check box at the specified position is checked.
<i>IsCellHotspot</i>	Returns true if the cell is a link.
<i>IsCellSymbol</i>	Returns true if the text in the cell is displayed in the SAP symbol font.
<i>IsCellTotalExpander</i>	Returns true if the specified cell contains a total expander button.
<i>IsColumnFiltered</i>	Returns true if the specified column is filtered.
<i>IsColumnKey</i>	Returns true if the specified column is a key column.
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>IsToolbarButtonChecked</i>	Returns true if the specified tool bar button is checked.
<i>IsToolbarButtonEnabled</i>	Returns true if the specified button is enabled.
<i>IsTotalRowExpanded</i>	whether the specified total row is expanded.
<i>ModifyCell</i>	Modifies the value of the specified cell.
<i>ModifyCheckBox</i>	Modifies the value of the specified checkbox cell.
<i>MoveRows</i>	Moves the rows with an index greater than or equal to fromRow up to an index less than or equal to toRow to the position of destRow.
<i>PressButton</i>	Presses the button placed in the specified cell.
<i>PressButtonCurrentCell</i>	Clicks a button placed in the current cell.
<i>PressColumnHeader</i>	Clicks on the header of the specified column.
<i>PressEnter</i>	Presses the enter key.
<i>PressF1</i>	Presses the F1 key.
<i>PressF4</i>	Presses the F4 key.
<i>PressToolbarButton</i>	Clicks the specified button in the grid view's tool bar.
<i>PressToolbarContextButton</i>	Opens the context menu of the specified button of the grid view's tool bar.
<i>PressTotalRow</i>	Presses the row button of the specified total row.
<i>PressTotalRowCurrentCell</i>	Presses the expansion button on the current cell.
<i>SelectAll</i>	Selects the whole grid content (i.e. all rows and all columns).
<i>SelectColumn</i>	Adds the specified column to the list of the selected columns.
<i>SelectContextMenuItem</i>	Select an item from the controls context menu. (Inherited from <i>ISapContextMenuable</i>)
<i>SelectContextMenuItemByPosition</i>	This method allows you to select a context menu item using the position of the item. (Inherited from <i>ISapContextMenuable</i>)
<i>SelectContextMenuItemByText</i>	Select a menu item of a context menu using the text of the item and possible higher level menus. (Inherited from <i>ISapContextMenuable</i>)
<i>SelectionChanged</i>	Notifies the server that the selection has changed
<i>SelectToolbarMenuItem</i>	Selects an item from the context menu of the grid view's tool bar.

Name	Description
SetColumnOrder	Sets the order of the columns.
SetColumnWidth	Sets the width of the specified column.
SetCurrentCell	Sets the specified cell as the current cell.
SetCurrentCellColumn	Specifies the column of the current cell.
SetCurrentCellRow	Sets the row of the current cell.
SetFirstVisibleColumn	Sets the first visible column.
SetFirstVisibleRow	Sets the first visible row.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
SetSelectedRows	Selects the specified rows.
ShowContextMenu	Shows the context menu of the control. (Inherited from SapComponent)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TriggerModified	Notifies the server of multiple changes in cells. Typically this method should be called after multiple calls to ModifyCell .
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider

Name	Description
WaitForObject	increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SapHorizontalScrollBar Class

Description

Class for horizontal scrollbars.

Inheritance Hierarchy

- [SapScrollbar](#)
 - SapHorizontalScrollBar

Syntax

```
'Declaration
Public Class SapHorizontalScrollBar _
Inherits SapScrollbar
```

Properties

Name	Description
Maximum	the maximum scrollbar value. (Inherited from SapScrollbar)
Minimum	the minimum scrollbar value. (Inherited from SapScrollbar)
PageSize	the scrollbar pagesize. (Inherited from SapScrollbar)
Position	the current scrollbar position. (Inherited from SapScrollbar)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject . (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)

Name	Description
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
ScrollTo	Scrolls to the given position. (Inherited from SapScrollbar)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SapHTMLViewer Class

Description

Class for SAP HTMLView.

Inheritance Hierarchy

- [SapShell](#)
 - SapHTMLViewer

Syntax

```
'Declaration
Public Class SapHTMLViewer _
Inherits SapShell _
Implements ISapContextMenuable
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from SapComponent)
Changeable	whether an object is changeable. (Inherited from SapComponent)
CurrentContextMenu	The current context menu. This is only set when a context menu is available at the shell object.
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from SapComponent)
DocumentComplete	whether the document is complete.

Name	Description
DragDropSupported	whether the shell allows drag and drop operations. (Inherited from SapShell)
Height	the current height of the component. (Inherited from SapComponent)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from SapComponent)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from SapComponent)
Left	the left position of the element in screen coordinates. (Inherited from SapComponent)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from SapComponent)
Name	the name of the component. (Inherited from SapComponent)
ScreenLeft	the left position of the component in screen coordinates. (Inherited from SapComponent)
ScreenTop	the top position of the component in screen coordinates. (Inherited from SapComponent)
Text	The text of the control. (Inherited from TestObject)
Tooltip	the tooltip text. (Inherited from SapComponent)
Top	the top coordinate of the element in screen coordinates. (Inherited from SapComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	the current width of the component. (Inherited from SapComponent)
WindowHandle	the window handle of the control that is connected to the GuiShell.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ContextMenu	Emulates the context menu request. Applies only to context menus provided by the backend.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the

Name	Description
	agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>SapEvent</i>	This function submits an HTML form to the backend.

Name	Description
SelectContextMenuItem	Select an item from the controls context menu. (Inherited from ISapContextMenuable)
SelectContextMenuItemByPosition	This method allows you to select a context menu item using the position of the item. (Inherited from ISapContextMenuable)
SelectContextMenuItemByText	Select a menu item of a context menu using the text of the item and possible higher level menus. (Inherited from ISapContextMenuable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
ShowContextMenu	Shows the context menu of the control. (Inherited from SapComponent)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SapLabel Class

Description

SapLabel class is the class for all SAP labels.

Inheritance Hierarchy

- [SapComponent](#)
 - SapLabel

Syntax

```
'Declaration
Public Class SapLabel _
Inherits SapComponent
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from SapComponent)
Changeable	whether an object is changeable. (Inherited from SapComponent)
CharLeft	the left coordinate of the label in character metric.
CharTop	the top coordinate of the label in character metric.
CharWidth	the width of the element in character metric.
ColorIndex	the color index of the label.
ColorInverse	whether the inverse color style is set for the label.

Name	Description
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from SapComponent)
DisplayedText	the text of the label.
Height	the current height of the component. (Inherited from SapComponent)
Highlighted	whether the label has the 'highlighted' flag assigned.
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from SapComponent)
IsHotspot	whether a mouse click on the label causes a round trip.
IsLeftLabel	whether the component has the 'assign left' flag assigned.
IsListElement	whether the element is on an ABAP list.
IsRightLabel	whether the component has the 'assign right' flag assigned.
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from SapComponent)
Left	the left position of the element in screen coordinates. (Inherited from SapComponent)
Maxlength	the maximum text length of the label in code units.
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from SapComponent)
Name	the name of the component. (Inherited from SapComponent)
Numerical	whether the label may only contain numbers.
ScreenLeft	the left position of the component in screen coordinates. (Inherited from SapComponent)
ScreenTop	the top position of the component in screen coordinates. (Inherited from SapComponent)
Text	The text of the control. (Inherited from TestObject)
Tooltip	the tooltip text. (Inherited from SapComponent)
Top	the top coordinate of the element in screen coordinates. (Inherited from SapComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	the current width of the component. (Inherited from SapComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location

Name	Description
	<p>on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. <i>ImageExistsFile</i>	<p>Returns whether the specified image exists. (Inherited from <i>TestObject</i>)</p>
<i>ImageRectangle</i>	<p>Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)</p>

Name	Description
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
ShowContextMenu	Shows the context menu of the control. (Inherited from SapComponent)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SapMenu Class

Description

Class for SAP Menu.

Inheritance Hierarchy

- [SapComponent](#)
 - SapMenu
 - [SapContextMenu](#)

Syntax

```
'Declaration
Public Class SapMenu _
Inherits SapComponent
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from SapComponent)
Changeable	whether an object is changeable. (Inherited from SapComponent)

GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
Select	Select the menu.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
ShowContextMenu	Shows the context menu of the control. (Inherited from SapComponent)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)

Name	Description
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SapMenubar Class

Description

Class for SAP MenuBar.

Inheritance Hierarchy

- [SapComponent](#)
 - SapMenubar

Syntax

```
'Declaration  
Public Class SapMenubar _  
Inherits SapComponent
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from SapComponent)
Changeable	whether an object is changeable. (Inherited from SapComponent)
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from SapComponent)
Height	the current height of the component. (Inherited from SapComponent)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from SapComponent)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from SapComponent)
Left	the left position of the element in screen coordinates. (Inherited from SapComponent)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from SapComponent)
Name	the name of the component. (Inherited from SapComponent)
ScreenLeft	the left position of the component in screen coordinates. (Inherited from SapComponent)
ScreenTop	the top position of the component in screen coordinates. (Inherited from SapComponent)

Name	Description
Text	The text of the control. (Inherited from TestObject)
Tooltip	the tooltip text. (Inherited from SapComponent)
Top	the top coordinate of the element in screen coordinates. (Inherited from SapComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	the current width of the component. (Inherited from SapComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
ShowContextMenu	Shows the context menu of the control. (Inherited from SapComponent)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SapNetPlan Class

Description

Class for SAP Net Chart.

Inheritance Hierarchy

- [SapShell](#)
 - SapNetPlan

Syntax

```
'Declaration
Public Class SapNetPlan _
Inherits SapShell _
Implements ISapContextMenuable
```

Properties

Name	Description
AccessibilityDescription	the accessibility description of the shell.

Name	Description
<i>AccessibilityText</i>	an additional text for accessibility support. (Inherited from <i>SapComponent</i>)
<i>AccessibilityTextOnRequest</i>	an additional text for accessibility support. (Inherited from <i>SapComponent</i>)
<i>AccessibilityTooltip</i>	an additional tooltip text for accessibility support. (Inherited from <i>SapComponent</i>)
<i>Changeable</i>	whether an object is changeable. (Inherited from <i>SapComponent</i>)
<i>CurrentContextMenu</i>	The current context menu. This is only set when a context menu is available at the shell object.
<i>DefaultTooltip</i>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <i>SapComponent</i>)
<i>DragDropSupported</i>	whether the shell allows drag and drop operations. (Inherited from <i>SapShell</i>)
<i>Height</i>	the current height of the component. (Inherited from <i>SapComponent</i>)
<i>IconName</i>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <i>SapComponent</i>)
<i>IsSymbolFont</i>	whether the component's text is visualized in the SAP symbol font. (Inherited from <i>SapComponent</i>)
<i>Left</i>	the left position of the element in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>LinkCount</i>	the number of links in the net.
<i>Modified</i>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <i>SapComponent</i>)
<i>Name</i>	the name of the component. (Inherited from <i>SapComponent</i>)
<i>NodeCount</i>	the number of Nodes in the net.
<i>ScreenLeft</i>	the left position of the component in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>ScreenTop</i>	the top position of the component in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>Tooltip</i>	the tooltip text. (Inherited from <i>SapComponent</i>)
<i>Top</i>	the top coordinate of the element in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>Width</i>	the current width of the component. (Inherited from <i>SapComponent</i>)
<i>WindowHandle</i>	the window handle of the control that is connected to the GuiShell.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetLinkContent	Returns the content of the link.
GetNodeContent	Returns the content of the node.
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)

Name	Description
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>SelectContextMenuItem</i>	Select an item from the controls context menu. (Inherited from <i>ISapContextMenuable</i>)
<i>SelectContextMenuItemByPosition</i>	This method allows you to select a context menu item using the position of the item. (Inherited from <i>ISapContextMenuable</i>)
<i>SelectContextMenuItemByText</i>	Select a menu item of a context menu using the text of the item and possible higher level menus. (Inherited from <i>ISapContextMenuable</i>)
<i>SendData</i>	This function emulates the output of each action triggered at the control side. The result of the action is sent to the server.
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>ShowContextMenu</i>	Shows the context menu of the control. (Inherited from <i>SapComponent</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

Name	Description
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this <code>TestObject</code> . (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)

Name	Description
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
SelectContextMenuItem	Select an item from the controls context menu. (Inherited from ISapContextMenuable)
SelectContextMenuItemByPosition	This method allows you to select a context menu item using the position of the item. (Inherited from ISapContextMenuable)
SelectContextMenuItemByText	Select a menu item of a context menu using the text of the item and possible higher level menus. (Inherited from ISapContextMenuable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
ShowContextMenu	Shows the context menu of the control. (Inherited from SapComponent)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object,

Name	Description
	for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SapOkCodeField Class

Description

`SapOkCodeField` class is the class for `sap OkCodeField`.

Inheritance Hierarchy

- [SapComponent](#)
 - `SapOkCodeField`

Syntax

```
'Declaration
Public Class SapOkCodeField _
Inherits SapComponent
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from SapComponent)

Name	Description
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from SapComponent)
Changeable	whether an object is changeable. (Inherited from SapComponent)
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from SapComponent)
Height	the current height of the component. (Inherited from SapComponent)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from SapComponent)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from SapComponent)
Left	the left position of the element in screen coordinates. (Inherited from SapComponent)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from SapComponent)
Name	the name of the component. (Inherited from SapComponent)
Opened	whether the GuiOkCodeField is collapsed.
ScreenLeft	the left position of the component in screen coordinates. (Inherited from SapComponent)
ScreenTop	the top position of the component in screen coordinates. (Inherited from SapComponent)
Text	The text of the control. (Inherited from TestObject)
Tooltip	the tooltip text. (Inherited from SapComponent)
Top	the top coordinate of the element in screen coordinates. (Inherited from SapComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	the current width of the component. (Inherited from SapComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)

Name	Description
<i>Close</i>	Collapses the GuiOkCodeField.
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <i>TestObject</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <i>TestObject</i>)

Name	Description
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>Open</i>	Expands the GuiOkCodeField.
<i>PressF1</i>	Emulate pressing the F1 key while the focus is on the GuiOkCodeField.
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>SetText</i>	Sets the text of the control to the specified text.
<i>ShowContextMenu</i>	Shows the context menu of the control. (Inherited from <i>SapComponent</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

Name	Description
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SapPicture Class

Description

Class for SAP picture.

Inheritance Hierarchy

- [SapShell](#)
 - SapPicture

Syntax

```
'Declaration
Public Class SapPicture _
Inherits SapShell _
Implements ISapContextMenuable
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from SapComponent)
Changeable	whether an object is changeable. (Inherited from SapComponent)
CurrentContextMenu	The current context menu. This is only set when a context menu is available at the shell object.
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from SapComponent)
DisplayMode	the display mode of the picture, i.e. "Normal", "Stretch", "Fit", "NormalCenter", "FitCenter"

Name	Description
DragDropSupported	whether the shell allows drag and drop operations. (Inherited from SapShell)
Height	the current height of the component. (Inherited from SapComponent)
Icon	the SAPGUI icon code e.g. ("@01@")
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from SapComponent)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from SapComponent)
Left	the left position of the element in screen coordinates. (Inherited from SapComponent)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from SapComponent)
Name	the name of the component. (Inherited from SapComponent)
ScreenLeft	the left position of the component in screen coordinates. (Inherited from SapComponent)
ScreenTop	the top position of the component in screen coordinates. (Inherited from SapComponent)
Text	The text of the control. (Inherited from TestObject)
Tooltip	the tooltip text. (Inherited from SapComponent)
Top	the top coordinate of the element in screen coordinates. (Inherited from SapComponent)
Url	the URL of the picture
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	the current width of the component. (Inherited from SapComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	clicks on a picture
ClickControlArea	clicks on the specified position

Name	Description
ClickPictureArea	clicks on the specified position in the picture area
ContextMenu	The function opens a context menu on the given position. The coordinates should be given in pixels with respect to the picture control as it is displayed on the screen.
DoubleClick	double clicks on the picture
DoubleClickControlArea	double clicks on the specified position
DoubleClickPictureArea	double clicks on the specified position in the picture area
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)

Name	Description
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
SelectContextMenuItem	Select an item from the controls context menu. (Inherited from ISapContextMenuable)
SelectContextMenuItemByPosition	This method allows you to select a context menu item using the position of the item. (Inherited from ISapContextMenuable)
SelectContextMenuItemByText	Select a menu item of a context menu using the text of the item and possible higher level menus. (Inherited from ISapContextMenuable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
ShowContextMenu	Shows the context menu of the control. (Inherited from SapComponent)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a

Name	Description
WaitForObject	WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SapRadioButton Class

Description

SapRadioButton class is the class for radio button controls.

Inheritance Hierarchy

- [SapComponent](#)
 - SapRadioButton

Syntax

```
'Declaration
Public Class SapRadioButton _
Inherits SapComponent
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from SapComponent)
Changeable	whether an object is changeable. (Inherited from SapComponent)

Name	Description
CharHeight	the height of the element in character metric
CharLeft	the left coordinate of the element in character metric
CharTop	the top coordinate of the element in character metric
CharWidth	the width of the element in character metric
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from SapComponent)
Flushing	whether the value change causes a round trip
Height	the current height of the component. (Inherited from SapComponent)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from SapComponent)
IsLeftLabel	whether the component has the 'assign left' flag
IsRightLabel	whether the component has the 'assign right' flag
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from SapComponent)
Left	the left position of the element in screen coordinates. (Inherited from SapComponent)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from SapComponent)
Name	the name of the component. (Inherited from SapComponent)
ScreenLeft	the left position of the component in screen coordinates. (Inherited from SapComponent)
ScreenTop	the top position of the component in screen coordinates. (Inherited from SapComponent)
Selected	whether the radio button is selected
Text	The text of the control. (Inherited from TestObject)
Tooltip	the tooltip text. (Inherited from SapComponent)
Top	the top coordinate of the element in screen coordinates. (Inherited from SapComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	the current width of the component. (Inherited from SapComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location

Name	Description

SapScrollbar Class

Description

Class for SAP Scrollbar.

Inheritance Hierarchy

- [TestObject](#)
 - SapScrollbar
 - [SapHorizontalScrollBar](#)
 - [SapVerticalScrollBar](#)

Syntax

```
'Declaration
Public Class SapScrollbar _
Inherits TestObject
```

Properties

Name	Description
Maximum	the maximum scrollbar value.
Minimum	the minimum scrollbar value.
PageSize	the scrollbar pagesize.
Position	the current scrollbar position.
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)

<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)

Name	Description
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>ShowContextMenu</i>	Shows the context menu of the control. (Inherited from <i>SapComponent</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)

Name	Description
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option OPT_WAIT_RESOLVE_OBJDEF. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SapShell Class

Description

Class for SAP SapShell.

Inheritance Hierarchy

- [SapComponent](#)
 - SapShell
 - [SapBarChart](#)
 - [SapCalendar](#)
 - [SapChart](#)
 - [SapColorSelector](#)
 - [SapGridView](#)
 - [SapHTMLViewer](#)
 - [SapNetPlan](#)
 - [SapOfficeIntegration](#)
 - [SapPicture](#)
 - [SapTextEdit](#)
 - [SapToolbarControl](#)
 - [SapTree](#)

Syntax

```
'Declaration  
Public Class SapShell _  
Inherits SapComponent
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from SapComponent)
Changeable	whether an object is changeable. (Inherited from SapComponent)
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from SapComponent)
DragDropSupported	whether the shell allows drag and drop operations.
Height	the current height of the component. (Inherited from SapComponent)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from SapComponent)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from SapComponent)
Left	the left position of the element in screen coordinates. (Inherited from SapComponent)

Name	Description
<i>Modified</i>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <i>SapComponent</i>)
<i>Name</i>	the name of the component. (Inherited from <i>SapComponent</i>)
<i>ScreenLeft</i>	the left position of the component in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>ScreenTop</i>	the top position of the component in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>Tooltip</i>	the tooltip text. (Inherited from <i>SapComponent</i>)
<i>Top</i>	the top coordinate of the element in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>Width</i>	the current width of the component. (Inherited from <i>SapComponent</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)

Name	Description
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>ShowContextMenu</i>	Shows the context menu of the control. (Inherited from <i>SapComponent</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)

Name	Description
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SapStatusbar Class

Description

Class for SAP statusbar.

Inheritance Hierarchy

- [SapComponent](#)
 - SapStatusbar

Syntax

```
'Declaration  
Public Class SapStatusbar _  
Inherits SapComponent
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from SapComponent)
Changeable	whether an object is changeable. (Inherited from SapComponent)
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from SapComponent)
Height	the current height of the component. (Inherited from SapComponent)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from SapComponent)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from SapComponent)
Left	the left position of the element in screen coordinates. (Inherited from SapComponent)
MessageId	the name of the message class used in the ABAP message call
MessageNumber	the message number used in the ABAP message call
MessageType	the type of the displayed message in the statusbar, i.e. S (Success), W (Warning), E (Error), A (Abort), I (Information)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from SapComponent)
Name	the name of the component. (Inherited from SapComponent)

Name	Description
ScreenLeft	the left position of the component in screen coordinates. (Inherited from SapComponent)
ScreenTop	the top position of the component in screen coordinates. (Inherited from SapComponent)
Text	The text of the control. (Inherited from TestObject)
Tooltip	the tooltip text. (Inherited from SapComponent)
Top	the top coordinate of the element in screen coordinates. (Inherited from SapComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	the current width of the component. (Inherited from SapComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
DoubleClick	double-clicks the statusbar
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)

Name	Description
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>ShowContextMenu</i>	Shows the context menu of the control. (Inherited from <i>SapComponent</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

Name	Description
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SapTab Class

Description

Class for SAP Tab.

Inheritance Hierarchy

- [SapComponent](#)
 - SapTab

Syntax

```
'Declaration
Public Class SapTab _
Inherits SapComponent
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from SapComponent)
Changeable	whether an object is changeable. (Inherited from SapComponent)
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from SapComponent)
Height	the current height of the component. (Inherited from SapComponent)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from SapComponent)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from SapComponent)
Left	the left position of the element in screen coordinates. (Inherited from SapComponent)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from SapComponent)
Name	the name of the component. (Inherited from SapComponent)
ScreenLeft	the left position of the component in screen coordinates. (Inherited from SapComponent)
ScreenTop	the top position of the component in screen coordinates. (Inherited from SapComponent)
Text	The text of the control. (Inherited from TestObject)
Tooltip	the tooltip text. (Inherited from SapComponent)
Top	the top coordinate of the element in screen coordinates. (Inherited from SapComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	the current width of the component. (Inherited from SapComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored

Name	Description
	in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)

Name	Description
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
Select	Selects the tab
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
ShowContextMenu	Shows the context menu of the control. (Inherited from SapComponent)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SapTable Class

Description

SapTable class is the class for SAP tables.

Inheritance Hierarchy

- [SapComponent](#)
 - SapTable

Syntax

```
'Declaration
Public Class SapTable _
Inherits SapComponent
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from SapComponent)
Changeable	whether an object is changeable. (Inherited from SapComponent)
CharHeight	the height of the element in character metric.
CharLeft	the left coordinate of the element in character metric.
CharTop	the top coordinate of the element in character metric.
CharWidth	the width of the element in character metric.
ColumnCount	the number of columns in the table.
ColumnSelectionMode	the column selection mode

Name	Description
<i>CurrentColumn</i>	the index of the current column.
<i>CurrentRow</i>	the index of the current row.
<i>DefaultTooltip</i>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <i>SapComponent</i>)
<i>Height</i>	the current height of the component. (Inherited from <i>SapComponent</i>)
<i>IconName</i>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <i>SapComponent</i>)
<i>IsSymbolFont</i>	whether the component's text is visualized in the SAP symbol font. (Inherited from <i>SapComponent</i>)
<i>Left</i>	the left position of the element in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>Modified</i>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <i>SapComponent</i>)
<i>Name</i>	the name of the component. (Inherited from <i>SapComponent</i>)
<i>RowCount</i>	the number of rows in the table including invisible rows.
<i>RowSelectionMode</i>	the row selection mode.
<i>ScreenLeft</i>	the left position of the component in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>ScreenTop</i>	the top position of the component in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>TableFieldName</i>	the table field name.
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>Tooltip</i>	the tooltip text. (Inherited from <i>SapComponent</i>)
<i>Top</i>	the top coordinate of the element in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>VisibleRowCount</i>	the number of visible rows in the table.
<i>Width</i>	the current width of the component. (Inherited from <i>SapComponent</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha

Name	Description
	channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ConfigureLayout	Opens the configuration layout dialog, in which the layout of the table can be changed.
DeselectAllColumns	This function can be used for table controls with a button that allows to de-select all columns in one step.
DeselectColumn	Deselects the given column.
DeselectRow	Deselects the given row.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetCell	Returns a visible table cell.
GetCellAbsolute	Returns a table cell. If the row is not visible, it will be scrolled into view.
GetCellsForRow	Returns the cells for the given row.
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetColumnName	This method returns the title of the given column.
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetVisibleCellsForColumn	Returns the visible cells for the given column.

Name	Description
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsColumnSelected</i>	Returns true if the given column is selected.
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>IsRowSelected</i>	Returns true if the given row is selected.
<i>ReorderTable</i>	This method re-orders the columns.
<i>SelectAllColumns</i>	This function can be used for table controls with a button that allows to select all columns in one step.
<i>SelectColumn</i>	Selects the given column.
<i>SelectRow</i>	Selects the given row.
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>ShowContextMenu</i>	Shows the context menu of the control. (Inherited from <i>SapComponent</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
WaitForDisappearance	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject) Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SapTabStrip Class

Description

Class for SAP tab pane.

Inheritance Hierarchy

- [SapComponent](#)
 - SapTabStrip

Syntax

```
'Declaration  
Public Class SapTabStrip _  
Inherits SapComponent
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from SapComponent)
Changeable	whether an object is changeable. (Inherited from SapComponent)
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from SapComponent)
Height	the current height of the component. (Inherited from SapComponent)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from SapComponent)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from SapComponent)
Left	the left position of the element in screen coordinates. (Inherited from SapComponent)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from SapComponent)
Name	the name of the component. (Inherited from SapComponent)
ScreenLeft	the left position of the component in screen coordinates. (Inherited from SapComponent)
ScreenTop	the top position of the component in screen coordinates. (Inherited from SapComponent)
SelectedTab	the current selected tab.
Tabs	all tabs of the tab pane.
Text	The text of the control. (Inherited from TestObject)
Tooltip	the tooltip text. (Inherited from SapComponent)
Top	the top coordinate of the element in screen coordinates. (Inherited from SapComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	the current width of the component. (Inherited from SapComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)

WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the

Name	Description
	optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SapTextEdit Class

Description

Class for SAP TextEdit.

Inheritance Hierarchy

- [SapShell](#)
 - SapTextEdit

Syntax

```
'Declaration
Public Class SapTextEdit _
Inherits SapShell
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from SapComponent)
Changeable	whether an object is changeable. (Inherited from SapComponent)
CurrentColumn	the column index in which the caret is currently positioned.
CurrentContextMenu	The current context menu. This is only set when a context menu is available at the shell object.
CurrentLine	the line index in which the caret is currently positioned.

Name	Description
<i>DefaultTooltip</i>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <i>SapComponent</i>)
<i>DragDropSupported</i>	whether the shell allows drag and drop operations. (Inherited from <i>SapShell</i>)
<i>FirstVisibleLine</i>	the first visible line which is visualized at the top border of the text edit control.
<i>Height</i>	the current height of the component. (Inherited from <i>SapComponent</i>)
<i>IconName</i>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <i>SapComponent</i>)
<i>IsSymbolFont</i>	whether the component's text is visualized in the SAP symbol font. (Inherited from <i>SapComponent</i>)
<i>LastVisibleLine</i>	the last visible line which is visualized at the bottom border of the text edit control.
<i>Left</i>	the left position of the element in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>LineCount</i>	the number of all lines in the text edit control.
<i>Modified</i>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <i>SapComponent</i>)
<i>Name</i>	the name of the component. (Inherited from <i>SapComponent</i>)
<i>ScreenLeft</i>	the left position of the component in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>ScreenTop</i>	the top position of the component in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>SelectedText</i>	the currently selected text.
<i>SelectionEndColumn</i>	the column index in which the selection ends.
<i>SelectionEndLine</i>	the line index in which the selection ends.
<i>SelectionIndexEnd</i>	the overall end index of the text selection.
<i>SelectionIndexStart</i>	the overall start index of the text selection.
<i>SelectionStartColumn</i>	the column start index of the text selection.
<i>SelectionStartLine</i>	the line index in which the selection starts.
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>Tooltip</i>	the tooltip text. (Inherited from <i>SapComponent</i>)
<i>Top</i>	the top coordinate of the element in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)

Name	Description
Width	the current width of the component. (Inherited from SapComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
ContextMenu	Requests the context menu.
DoubleClick	Double clicks the text edit control.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetLineText	Returns the text of the specified line.
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)

Name	Description
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsBreakpointLine	whether the specified line contains a breakpoint.
IsCommentLine	Returns true if the specified line is a comment line.
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
IsHighlightedLine	Returns true if the specified line is highlighted.
IsProtectedLine	Returns true if the specified line is protected.
PressF1	Presses the F1 key.
PressF4	Presses the F4 key.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
SetSelectionIndexes	Selects the text within the specified range.
SetText	Sets the specified text in the text edit control.
ShowContextMenu	Shows the context menu of the control. (Inherited from SapComponent)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
WaitForDisappearance	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject) Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SapTextField Class

Description

SapTextField is the class for single-line and multi-line fields whose text can be modified by the user.

Inheritance Hierarchy

- [SapComponent](#)
 - SapTextField

Syntax

```
'Declaration  
Public Class SapTextField _  
Inherits SapComponent
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from SapComponent)
Changeable	whether an object is changeable. (Inherited from SapComponent)
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from SapComponent)
DisplayedText	the text as it is displayed on the screen, including preceding or trailing blanks.
Height	the current height of the component. (Inherited from SapComponent)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from SapComponent)
IsPassword	whether the text field is a password text field.
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from SapComponent)
Left	the left position of the element in screen coordinates. (Inherited from SapComponent)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from SapComponent)
Name	the name of the component. (Inherited from SapComponent)
ScreenLeft	the left position of the component in screen coordinates. (Inherited from SapComponent)
ScreenTop	the top position of the component in screen coordinates. (Inherited from SapComponent)
Text	The text of the control. (Inherited from TestObject)
Tooltip	the tooltip text. (Inherited from SapComponent)
Top	the top coordinate of the element in screen coordinates. (Inherited from SapComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Name	Description
Width	the current width of the component. (Inherited from SapComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. SapToolBarControl Class

Description

Class for SAP ToolBarControl.

Inheritance Hierarchy

- [SapShell](#)
 - SapToolBarControl

Syntax

```
'Declaration
Public Class SapToolBarControl _
Inherits SapShell _
Implements ISapContextMenuable
```

Properties

Name	Description
<i>AccessibilityText</i>	an additional text for accessibility support. (Inherited from <i>SapComponent</i>)
<i>AccessibilityTextOnRequest</i>	an additional text for accessibility support. (Inherited from <i>SapComponent</i>)
<i>AccessibilityTooltip</i>	an additional tooltip text for accessibility support. (Inherited from <i>SapComponent</i>)
<i>ButtonCount</i>	the number of toolbar buttons including separators.
<i>Changeable</i>	whether an object is changeable. (Inherited from <i>SapComponent</i>)
<i>CurrentContextMenu</i>	The current context menu. This is only set when a context menu is available at the shell object.
<i>DefaultTooltip</i>	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from <i>SapComponent</i>)
<i>DragDropSupported</i>	whether the shell allows drag and drop operations. (Inherited from <i>SapShell</i>)
<i>FocusedButton</i>	the zero-based index of the button that currently has the focus.
<i>Height</i>	the current height of the component. (Inherited from <i>SapComponent</i>)
<i>IconName</i>	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from <i>SapComponent</i>)
<i>IsSymbolFont</i>	whether the component's text is visualized in the SAP symbol font. (Inherited from <i>SapComponent</i>)
<i>Left</i>	the left position of the element in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>Modified</i>	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from <i>SapComponent</i>)
<i>Name</i>	the name of the component. (Inherited from <i>SapComponent</i>)
<i>ScreenLeft</i>	the left position of the component in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>ScreenTop</i>	the top position of the component in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>Tooltip</i>	the tooltip text. (Inherited from <i>SapComponent</i>)
<i>Top</i>	the top coordinate of the element in screen coordinates. (Inherited from <i>SapComponent</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>Width</i>	the current width of the component. (Inherited from <i>SapComponent</i>)

Name	Description
WindowHandle	the window handle of the control that is connected to the GuiShell.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetButtonIcon	the name of the icon of the specified toolbar button.
GetButtonType	the type of the specified toolbar button. Possible values are: "Button", "ButtonAndMenu", "Menu", "Separator", "Group", "CheckBox"
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)

Name	Description
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsButtonChecked</i>	if the button is currently checked (pressed).
<i>IsButtonEnabled</i>	if the button can be pressed.
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>PressContextButton</i>	Press the context button with the given id.
<i>SelectButton</i>	emulates pressing the button with the given id.
<i>SelectContextMenuItem</i>	Select an item from the controls context menu. (Inherited from <i>ISapContextMenuable</i>)
<i>SelectContextMenuItemByPosition</i>	This method allows you to select a context menu item using the position of the item. (Inherited from <i>ISapContextMenuable</i>)
<i>SelectContextMenuItemByText</i>	Select a menu item of a context menu using the text of the item and possible higher level menus. (Inherited from <i>ISapContextMenuable</i>)
<i>SelectMenuItem</i>	emulates selecting the menu item with the given id.
<i>SelectMenuItemByText</i>	emulates selecting the menu item by menu item text.
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>ShowContextMenu</i>	Shows the context menu of the control. (Inherited from <i>SapComponent</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)

Name	Description
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SapTree Class

Description

SapTree class is the class for all SAP trees. Some of the methods that have Get as a prefix require the `nodeKey` and the `itemName` as input parameters of type string. These parameters are different for each individual SapTree element. To obtain the value of these parameters, record an action on the desired item and use the parameters that you have recorded.

Inheritance Hierarchy

- [SapShell](#)
 - SapTree

Syntax

```
'Declaration  
Public Class SapTree _  
Inherits SapShell _  
Implements ISapContextMenuable
```

Properties

Name	Description
AccessibilityDescription	the accessibility description of the shell.
AccessibilityText	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from SapComponent)
Changeable	whether an object is changeable. (Inherited from SapComponent)
ColumnHeaders	a collection of the titles of the columns.
ColumnNames	a collection of the column names.
ColumnOrder	the column order.
ColumnTitles	a collection of the titles of the columns.
CurrentContextMenu	The current context menu. This is only set when a context menu is available at the shell object.
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from SapComponent)
DragDropSupported	whether the shell allows drag and drop operations. (Inherited from SapShell)
FocusedNodeKey	the key of the focused node.
Height	the current height of the component. (Inherited from SapComponent)
HierarchyHeaderWidth	the width of the hierarchy header in pixels.
HierarchyTitle	the hierarchy title.
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from SapComponent)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from SapComponent)

Name	Description
Left	the left position of the element in screen coordinates. (Inherited from SapComponent)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from SapComponent)
Name	the name of the component. (Inherited from SapComponent)
NodeKeys	a collection containing either the node key of the root node, or the node keys of all nodes in the tree, depending on the application.
ScreenLeft	the left position of the component in screen coordinates. (Inherited from SapComponent)
ScreenTop	the top position of the component in screen coordinates. (Inherited from SapComponent)
SelectedItemColumn	the key of the currently selected item column.
SelectedItemNode	the key of the currently selected item node.
SelectedNode	the key of the currently selected node.
SelectedNodes	a collection containing the node keys of all the selected nodes in the tree.
SelectionMode	the selection mode.
Text	The text of the control. (Inherited from TestObject)
Tooltip	the tooltip text. (Inherited from SapComponent)
Top	the top coordinate of the element in screen coordinates. (Inherited from SapComponent)
TopNode	the key of the top node.
TreeType	the tree type. (simple tree, list tree or column tree)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	the current width of the component. (Inherited from SapComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ChangeCheckbox	This method emulates changing a checkbox state.
CollapseNode	This function closes the node with the key nodeKey.

Name	Description
DefaultContextMenu	This method requests a context menu for the whole Tree Control.
DoubleSelectedItem	This function emulates double clicking on a text item.
DoubleSelectNode	This function emulates double clicking a node.
EnsureVisibleHorizontalItem	This function scrolls the Tree horizontally until the Item is visible.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
ExpandNode	This function expands the node with the key nodeKey.
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
FindNodeKeyByPath	Return the node key for the given path (e.g. 2\1\2).
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetAbapImage	Gets the abap image.
GetCheckBoxState	Retrieves the CheckBox state (true = Checked, false = Unchecked).
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetColumnIndexFromName	Gets the column index for the given name.
GetColumnKeys	The keys of all the items in the given column.
GetColumnTitleFromName	Gets the column title for the given name.
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetHierarchyLevel	Gets the hierarchy level for the given key.
GetItemHeight	Returns the current item height.
GetItemLeft	The left position of the component.
GetItemStyle	The style of the given item.
GetItemText	For multi column trees, this function returns the text of the item specified by the key and name parameters.
GetItemTextColor	Returns the item text color.
GetItemTooltip	Returns the item tooltip text.
GetItemTop	The top position of the component.
GetItemType	Returns the type of the given node.

Name	Description
<i>GetItemWidth</i>	Returns the current item width.
<i>GetListTreeNodeItemCount</i>	Returns the node item count.
<i>GetNextNodeKey</i>	Returns the key of the next node.
<i>GetNodeAbapImage</i>	Returns the abap image for the given node.
<i>GetNodeChildrenCount</i>	This function returns the number of children of the node given.
<i>GetNodeChildrenCountByPath</i>	This function returns the number of children of the node given by the path parameter (e.g. 2\1\2).
<i>GetNodeHeight</i>	The current height of the node.
<i>GetNodeIndex</i>	The index of the given node.
<i>GetNodeItemHeaders</i>	Returns the headers for the given node.
<i>GetNodeLeft</i>	The left position of the component.
<i>GetNodePathByKey</i>	Given a node key, the path is retrieved (e.g. 2\1\2).
<i>GetNodeStyle</i>	Returns the style of the node.
<i>GetNodeText</i>	This function returns the text of the node specified by the given key.
<i>GetNodeTextByPath</i>	The text of a node defined by the given path is returned.
<i>GetNodeTextColor</i>	Returns the node text color.
<i>GetNodeTooltip</i>	Returns the node tooltip text.
<i>GetNodeTop</i>	The top position of the component.
<i>GetNodeWidth</i>	Returns the current node width.
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetParentNodeKey</i>	Key of the parent node of the node specified by the given key.
<i>GetPreviousNodeKey</i>	Key of the previous node of the node specified by the given key.
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>GetStyleDescription</i>	Returns the description for the given style.
<i>GetSubNodesKeys</i>	Collection of the keys of all subnodes of the node specified by the given key.
<i>HeaderContextMenu</i>	This method requests a context menu for a header.
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)

Name	Description
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>IsFolder</i>	Whether the given node is a folder.
<i>IsFolderExpandable</i>	Whether the folder is expandable.
<i>IsFolderExpanded</i>	Whether the folder is expanded.
<i>IsHighLighted</i>	Whether the node is highlighted.
<i>ItemContextMenu</i>	This method requests a context menu for an item.
<i>NodeContextMenu</i>	This method requests a context menu for a node.
<i>PressKey</i>	This method emulates pressing a key.
<i>SelectButton</i>	This method emulates pressing a button.
<i>SelectColumn</i>	This function adds a column to the column selection. A node or item selection is removed.
<i>SelectContextMenuItem</i>	Select an item from the controls context menu. (Inherited from <i>ISapContextMenuable</i>)
<i>SelectContextMenuItemByPosition</i>	This method allows you to select a context menu item using the position of the item. (Inherited from <i>ISapContextMenuable</i>)
<i>SelectContextMenuItemByText</i>	Select a menu item of a context menu using the text of the item and possible higher level menus. (Inherited from <i>ISapContextMenuable</i>)
<i>SelectHeader</i>	This method emulates clicking a header.
<i>SelectItem</i>	This function emulates the selection of an item. This selection removes all other selections.
<i>SelectLink</i>	This function emulates triggering a link.
<i>SelectNode</i>	The node with the key <code>nodeKey</code> is added to the Node Selection.
<i>SetCheckBoxState</i>	Changes the state of the checkbox in the given node.
<i>SetColumnOrder</i>	Sets the order of the tree's column.
<i>SetColumnWidth</i>	This function sets the width of a column in pixels.
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)

Name	Description
SetHierarchyHeaderWidth	Sets the width of the Hierarchy Header in pixels.
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
SetSelectedNode	Select the given node.
SetTopNode	Sets the given key as top node.
ShowContextMenu	Shows the context menu of the control. (Inherited from SapComponent)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
UnselectAll	All selections are removed.
UnselectColumn	This function removes a column from the column selection.
UnselectNode	The node with the key nodeKey is removed from the Node Selection.
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SapUserArea Class

Description

Class for SAP UserArea.

Inheritance Hierarchy

- [SapComponent](#)
 - SapUserArea

Syntax

```
'Declaration
Public Class SapUserArea _
Inherits SapComponent _
Implements ISapContextMenuable
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from SapComponent)
Changeable	whether an object is changeable. (Inherited from SapComponent)
CurrentContextMenu	The current context menu. This is only set when a context menu is available at the shell object.
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from SapComponent)
Height	the current height of the component. (Inherited from SapComponent)

Name	Description
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from SapComponent)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from SapComponent)
Left	the left position of the element in screen coordinates. (Inherited from SapComponent)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from SapComponent)
Name	the name of the component. (Inherited from SapComponent)
ScreenLeft	the left position of the component in screen coordinates. (Inherited from SapComponent)
ScreenTop	the top position of the component in screen coordinates. (Inherited from SapComponent)
Text	The text of the control. (Inherited from TestObject)
Tooltip	the tooltip text. (Inherited from SapComponent)
Top	the top coordinate of the element in screen coordinates. (Inherited from SapComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	the current width of the component. (Inherited from SapComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)

Name	Description
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
SelectContextMenuItem	Select an item from the controls context menu. (Inherited from ISapContextMenuable)
SelectContextMenuItemByPosition	This method allows you to select a context menu item using the position of the item. (Inherited from ISapContextMenuable)
SelectContextMenuItemByText	Select a menu item of a context menu using the text of the item and possible higher level menus. (Inherited from ISapContextMenuable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)

Name	Description
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>ShowContextMenu</i>	Shows the context menu of the control. (Inherited from <i>SapComponent</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout

Name	Description
	parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SapVerticalScrollBar Class

Description

Class for vertical scrollbars.

Inheritance Hierarchy

- [SapScrollbar](#)
 - SapVerticalScrollBar

Syntax

```
'Declaration
Public Class SapVerticalScrollBar _
Inherits SapScrollbar
```

Properties

Name	Description
Maximum	the maximum scrollbar value. (Inherited from SapScrollbar)
Minimum	the minimum scrollbar value. (Inherited from SapScrollbar)
PageSize	the scrollbar pagesize. (Inherited from SapScrollbar)
Position	the current scrollbar position. (Inherited from SapScrollbar)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is

Name	Description
	specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
ScrollTo	Scrolls to the given position. (Inherited from SapScrollbar)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)

Name	Description
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

SapWindow Class

Description

SapWindow class is the class for a top-level window.

Inheritance Hierarchy

- [SapComponent](#)
 - SapWindow

Syntax

```
'Declaration  
Public Class SapWindow _  
Inherits SapComponent _  
Implements IMoveable
```

Properties

Name	Description
AccessibilityText	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTextOnRequest	an additional text for accessibility support. (Inherited from SapComponent)
AccessibilityTooltip	an additional tooltip text for accessibility support. (Inherited from SapComponent)
ButtonbarVisible	whether the application toolbar, the lower toolbar within SAP GUI, is visible.
Changeable	whether an object is changeable. (Inherited from SapComponent)
DefaultTooltip	the tooltip text which is generated from the short text defined in the data dictionary for the given screen element type. (Inherited from SapComponent)
GuiFocus	the element within SAP GUI that currently has the focus.
Height	the current height of the component. (Inherited from SapComponent)
IconName	whether the object has been assigned an icon, then this property is the name of the icon, otherwise it is an empty string. (Inherited from SapComponent)
IsSymbolFont	whether the component's text is visualized in the SAP symbol font. (Inherited from SapComponent)
Left	the left position of the element in screen coordinates. (Inherited from SapComponent)
Modified	whether the state has been changed by the user and this change has not yet been sent to the SAP system. (Inherited from SapComponent)
Name	the name of the component. (Inherited from SapComponent)

Name	Description
ScreenLeft	the left position of the component in screen coordinates. (Inherited from SapComponent)
ScreenTop	the top position of the component in screen coordinates. (Inherited from SapComponent)
StatusbarVisible	whether the statusbar is visible.
SystemFocus	the element within SAP GUI that has the focus from the server application's perspective.
Text	The text of the control. (Inherited from TestObject)
TitlebarVisible	whether the titlebar is visible.
ToolbarVisible	whether the toolbar is visible.
Tooltip	the tooltip text. (Inherited from SapComponent)
Top	the top coordinate of the element in screen coordinates. (Inherited from SapComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	the current width of the component. (Inherited from SapComponent)
WindowHandle	the window handle of the control that is connected to the GuiShell.
WindowState	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from IMoveable)
WorkingPaneHeight	the current height of the working pane.
WorkingPaneWidth	the current width of the working pane.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Close	Closes the window. (Inherited from IMoveable)
CloseSynchron	Closes the window and waits until the window is closed. (Inherited from IMoveable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)

Name	Description
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetCloseWindows	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from IMoveable)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetFocus	Returns the object with the input focus. (Inherited from IMoveable)
GetNextCloseWindow	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from IMoveable)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)

Name	Description
<i>IsActive</i>	Returns whether the window is set to active. (Inherited from <i>IMoveable</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>IsVkeyAllowed</i>	The method returns True if the given virtual key can be executed on the current screen.
<i>JumpBackward</i>	Execute the Ctrl+Shift+Tab key on the window to jump backward one block.
<i>JumpForward</i>	Execute the Ctrl+Tab key on the window to jump forward one block.
<i>Maximize</i>	Maximizes the window. (Inherited from <i>IMoveable</i>)
<i>Minimize</i>	Reduces the window to an icon. (Inherited from <i>IMoveable</i>)
<i>Move</i>	Moves the window. (Inherited from <i>IMoveable</i>)
<i>ResizeWorkingPane</i>	The <code>ResizeWorkingPane</code> function will resize the window so that the available working area has the given width and height in character metric.
<i>ResizeWorkingPaneEx</i>	The <code>ResizeWorkingPaneEx</code> function will resize the window so that the available working area has the given width and height in pixels.
<i>Restore</i>	Restores the window to its previous size. (Inherited from <i>IMoveable</i>)
<i>SendVKey</i>	Send a virtual key to the system.
<i>SetActive</i>	Makes the window active. (Inherited from <i>IMoveable</i>)
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>ShowContextMenu</i>	Shows the context menu of the control. (Inherited from <i>SapComponent</i>)
<i>Size</i>	Resizes the window. (Inherited from <i>IMoveable</i>)
<i>TabBackward</i>	Execute the Shift+Tab key on the window to jump backward one element.
<i>TabForward</i>	Execute the Tab key on the window to jump forward one element.
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
WaitForDisappearance	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject) Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Silverlight Class Reference

Lists the available classes for testing Silverlight controls.

SLApplication Class

Description

The container for Silverlight controls.

Inheritance Hierarchy

- [SLBase](#)

- SLApplication

Syntax

```
'Declaration
Public Class SLApplication _
Inherits SLBase
```

Properties

Name	Description
<i>AutomationId</i>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <i>SLBase</i>)
<i>ClassName</i>	the simple class name of the element. (Inherited from <i>SLBase</i>)
<i>ControlType</i>	a string containing the control type for the element. (Inherited from <i>SLBase</i>)
<i>HelpText</i>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <i>SLBase</i>)
<i>IsEnabled</i>	a value that indicates whether the element is enabled. (Inherited from <i>SLBase</i>)
<i>Name</i>	a string containing the UI Automation name for the element. (Inherited from <i>SLBase</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i>)
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i>)
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)

Name	Description
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from SLBase)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)

Name	Description
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the

Name	Description
	optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SLAutoCompleteBox Class

Description

Represents a control that provides a text box for user input and a drop-down that contains possible matches based on the input in the text box.

Inheritance Hierarchy

- [SLBase](#)
 - SLAutoCompleteBox

Syntax

```
'Declaration
Public Class SLAutoCompleteBox _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from SLBase)
ClassName	the simple class name of the element. (Inherited from SLBase)
ControlType	a string containing the control type for the element. (Inherited from SLBase)
HelpText	a string containing the help text (e.g. tooltip text) for the element. (Inherited from SLBase)
HorizontallyScrollable	a value that indicates whether the combo box can scroll horizontally.
HorizontalScrollPercent	the current horizontal scroll position or negative one (-1) if there is no valid scroll position.

Name	Description
IsEnabled	a value that indicates whether the element is enabled. (Inherited from SLBase)
IsOpen	a value that indicates whether the auto complete box is open
Items	a list containing items of the current matches. If nothing was entered in the control's text box an empty list is returned.
ItemTexts	a list containing the texts of the current matches. If nothing was entered in the control's text box an empty list is returned.
Name	a string containing the UI Automation name for the element. (Inherited from SLBase)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
VerticallyScrollable	a value that indicates whether the combo box can scroll vertically.
VerticalScrollPercent	the current vertical scroll position or negative one (-1) if there is no valid scroll position.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
Close	Closes the drop-down list that contains the matches if it is currently open.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)

Name	Description
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from SLBase)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollHorizontal	Scrolls the currently visible region of the content area, horizontally, the specified ScrollAmount.
ScrollVertical	Scrolls the currently visible region of the content area, vertically, the specified ScrollAmount.
Select	Types the given text into the auto box complete box and selects a match.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetHorizontalScrollPercent	Sets the horizontal scroll position as a percentage of the total content area within the combo box.
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
SetVerticalScrollPercent	Sets the vertical scroll position as a percentage of the total content area within the combo box.
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use

Name	Description
	WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SLBase Class

Description

Provides a Silverlight framework-level set of properties, events, and methods for Silverlight elements.

Syntax

```
'Declaration
Public Class SLBase _
```

Inherits `TestObject` _
Implements `IClickable`, `IFocusable`, `IKeyable`

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element.
ClassName	the simple class name of the element.
ControlType	a string containing the control type for the element.
HelpText	a string containing the help text (e.g. tooltip text) for the element.
IsEnabled	a value that indicates whether the element is enabled.
Name	a string containing the UI Automation name for the element.
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)

Name	Description
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRawChildren</i>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type.
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)

Name	Description
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used.

Name	Description
	An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SLButton Class

Description

Identifies a button control.

Inheritance Hierarchy

- [SLBase](#)
 - SLButton

Syntax

```
'Declaration
Public Class SLButton _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from SLBase)
ClassName	the simple class name of the element. (Inherited from SLBase)
ControlType	a string containing the control type for the element. (Inherited from SLBase)
HelpText	a string containing the help text (e.g. tooltip text) for the element. (Inherited from SLBase)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from SLBase)
Name	a string containing the UI Automation name for the element. (Inherited from SLBase)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)

An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SLCalendar Class

Description

Identifies a calendar control.

Inheritance Hierarchy

- [SLBase](#)
 - `SLCalendar`

Syntax

```
'Declaration  
Public Class SLCalendar _  
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from SLBase)
CanSelectMultiple	whether multiple dates can be selected
ClassName	the simple class name of the element. (Inherited from SLBase)
ControlType	a string containing the control type for the element. (Inherited from SLBase)
DisplayMode	a value that indicates whether the calendar displays a month, year, or decade.
HelpText	a string containing the help text (e.g. tooltip text) for the element. (Inherited from SLBase)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from SLBase)
IsSelectionRequired	whether at least one date has to be selected
Name	a string containing the UI Automation name for the element. (Inherited from SLBase)
SelectedDate	the currently selected date in the currently displayed view.
SelectedDates	a list of selected dates in the currently displayed view.
SupportedDisplayModes	a list of supported display modes.
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)

Name	Description
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from SLBase)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)

Name	Description
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>SelectDate</i>	Selects the given date.
<i>SelectDates</i>	Selects the given dates.
<i>SelectRange</i>	Selects a range of dates.
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>SwitchToDecadeView</i>	Switches the calendar display mode to 'decade', if supported.
<i>SwitchToMonthView</i>	Switches the calendar display mode to 'month', if supported.
<i>SwitchToYearView</i>	Switches the calendar display mode to 'year', if supported.
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout

Name	Description
WaitForObject	parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject) Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option OPT_WAIT_RESOLVE_OBJDEF. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SLCalendarButton Class

Description

Identifies a calendar button.

Inheritance Hierarchy

- [SLBase](#)
 - SLCalendarButton

Syntax

```
'Declaration
Public Class SLCalendarButton _
Inherits SLBase
```

Properties

Name	Description
<i>AutomationId</i>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <i>SLBase</i>)
<i>ClassName</i>	the simple class name of the element. (Inherited from <i>SLBase</i>)

GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from SLBase)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)

Name	Description
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Select	Clicks the button.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SLCalendarDayButton Class

Description

Identifies a calendar day button.

Inheritance Hierarchy

- [SLBase](#)
 - SLCalendarDayButton

Syntax

```
'Declaration
Public Class SLCalendarDayButton _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from SLBase)
ClassName	the simple class name of the element. (Inherited from SLBase)
ControlType	a string containing the control type for the element. (Inherited from SLBase)
HelpText	a string containing the help text (e.g. tooltip text) for the element. (Inherited from SLBase)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from SLBase)
IsSelected	a value that indicates whether the calendar day button is selected
Name	a string containing the UI Automation name for the element. (Inherited from SLBase)
Text	The text of the control. (Inherited from TestObject)

Name	Description
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from SLBase)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Select	Clicks the button.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)

Name	Description
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SLCheckBox Class

Description

Identifies a check box control.

Inheritance Hierarchy

- [SLBase](#)
 - SLCheckBox

Syntax

```
'Declaration  
Public Class SLCheckBox _  
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from SLBase)

Name	Description
	agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRawChildren</i>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <i>SLBase</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)

Name	Description
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetIndeterminate	Set the check box to the indeterminate state.
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
Toggle	Cycles through the toggle states of the check box in this order: On, Off and, if supported, Indeterminate.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
Uncheck	Unchecks the check box.
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SLComboBox Class

Description

Identifies a combo box control.

Combo boxes in Silverlight require to be opened once before information about their items can be retrieved.

Inheritance Hierarchy

- [SLBase](#)
 - SLComboBox

Syntax

```
'Declaration
Public Class SLComboBox _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from SLBase)
ClassName	the simple class name of the element. (Inherited from SLBase)
ControlType	a string containing the control type for the element. (Inherited from SLBase)
HelpText	a string containing the help text (e.g. tooltip text) for the element. (Inherited from SLBase)
HorizontallyScrollable	a value that indicates whether the combo box can scroll horizontally.
HorizontalScrollPercent	the current horizontal scroll position or negative one (-1) if there is no valid scroll position.
IsEnabled	a value that indicates whether the element is enabled. (Inherited from SLBase)
IsOpen	a value that indicates whether the combo box is open
Items	a complete list of items.
ItemTexts	a complete list of item texts.
Name	a string containing the UI Automation name for the element. (Inherited from SLBase)
SelectedIndex	the index of the selected item or negative one (-1) if the selection is empty.
SelectedItem	the selected item or <code>Nothing</code> if the selection is empty.
SelectedItemText	the text of the selected item or an empty string if the selection is empty.
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
VerticallyScrollable	a value that indicates whether the combo box can scroll vertically.
VerticalScrollPercent	the current vertical scroll position or negative one (-1) if there is no valid scroll position.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)

Name	Description
Close	Closes the combo box.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from SLBase)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)

Name	Description
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Open	Opens the combo box.
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollHorizontal	Scrolls the currently visible region of the content area, horizontally, the specified ScrollAmount.
ScrollVertical	Scrolls the currently visible region of the content area, vertically, the specified ScrollAmount.
Select	Selects an item in the combo box.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetHorizontalScrollPercent	Sets the horizontal scroll position as a percentage of the total content area within the combo box.
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
SetVerticalScrollPercent	Sets the vertical scroll position as a percentage of the total content area within the combo box.
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)

Name	Description
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option OPT_WAIT_RESOLVE_OBJDEF. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SLComboBoxItem Class

MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Select	Selects the combo box item.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a

Name	Description
	WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SLDataGrid Class

Description

Identifies a data grid control.

If the data grid has a vertical scroll bar, rows which are not in the visible area of the data grid do not expose any information (e.g. text, caption). In order to interact with such a row or retrieve information about the row it needs to be scrolled into view first.

Inheritance Hierarchy

- [SLBase](#)
 - SLDataGrid

Syntax

```
'Declaration
Public Class SLDataGrid _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from SLBase)
CanSelectMultiple	whether the data grid allows more than one row to be selected concurrently.

Name	Description
ClassName	the simple class name of the element. (Inherited from SLBase)
ColumnCount	the number of columns in the data grid
ColumnHeaders	a list containing the header item for every column
ColumnHeaderTexts	a list containing the text of the header item for every column
ControlType	a string containing the control type for the element. (Inherited from SLBase)
HelpText	a string containing the help text (e.g. tooltip text) for the element. (Inherited from SLBase)
HorizontallyScrollable	a value that indicates whether the data grid can scroll horizontally.
HorizontalScrollPercent	the current horizontal scroll position or negative one (-1) if there is no valid scroll position.
IsEnabled	a value that indicates whether the element is enabled. (Inherited from SLBase)
Name	a string containing the UI Automation name for the element. (Inherited from SLBase)
RowCount	the number of rows in the data grid
Rows	a list of rows in the data grid
RowTexts	a list of row texts in the data grid. The text for every row is returned as a string that contains the text of every cell separated with a blank character.
SelectedCell	the currently selected cell or <code>Nothing</code> if no cell is selected
SelectedCellText	the text of the currently selected cell or an empty string if no cell is selected
SelectedRow	the currently selected row or <code>Nothing</code> if no row is selected
SelectedRows	a list of currently selected rows or an empty list if no row is selected
SelectedRowText	the text of the currently selected row or an empty string if no row is selected
SelectedRowTexts	the text of the currently selected rows or an empty list if no row is selected
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
VerticallyScrollable	a value that indicates whether the data grid can scroll vertically.
VerticalScrollPercent	the current vertical scroll position or negative one (-1) if there is no valid scroll position.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location

Name	Description
	on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i>)
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i>)
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRawChildren</i>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <i>SLBase</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)

Name	Description
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ScrollHorizontal</i>	Scrolls the currently visible region of the content area, horizontally, the specified <i>ScrollAmount</i> .
<i>ScrollIntoView</i>	Scrolls the specified row or cell into view.
<i>ScrollVertical</i>	Scrolls the currently visible region of the content area, vertically, the specified <i>ScrollAmount</i> .
<i>Select</i>	Selects the specified row.
<i>SelectCell</i>	Selects the specified cell.
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetHorizontalScrollPercent</i>	Sets the horizontal scroll position as a percentage of the total content area within the data grid.
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>SetVerticalScrollPercent</i>	Sets the vertical scroll position as a percentage of the total content area within the data grid.
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)

Name	Description
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SLDataGridCell Class

Description

Identifies a cell within a row of a data grid control.

Inheritance Hierarchy

- [SLBase](#)
 - SLDataGridCell

Syntax

```
'Declaration  
Public Class SLDataGridCell _  
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from SLBase)
ClassName	the simple class name of the element. (Inherited from SLBase)

If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout

Name	Description
	specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SLDataGridRow Class

Description

Identifies a row in data grid.

Inheritance Hierarchy

- [SLBase](#)
 - SLDataGridRow

Syntax

```
'Declaration
Public Class SLDataGridRow _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from SLBase)
Cells	the cells of the data grid row.
CellTexts	the text of the cells of the data grid row.
ClassName	the simple class name of the element. (Inherited from SLBase)
ControlType	a string containing the control type for the element. (Inherited from SLBase)
HelpText	a string containing the help text (e.g. tooltip text) for the element. (Inherited from SLBase)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from SLBase)
IsSelected	a value that indicates whether the row is selected.
Name	a string containing the UI Automation name for the element. (Inherited from SLBase)
RowHeader	the header for this row
Text	The text of the control. (Inherited from TestObject)

Name	Description
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)

GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from SLBase)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the row into view.
Select	Selects the row
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)

Name	Description
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SLDataPager Class

Description

Identifies a data pager for paging through a collection of data.

Inheritance Hierarchy

- [SLBase](#)
 - SLDataPager

Syntax

```
'Declaration
Public Class SLDataPager _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from SLBase)
ClassName	the simple class name of the element. (Inherited from SLBase)
ControlType	a string containing the control type for the element. (Inherited from SLBase)
CurrentPage	The current page.
HelpText	a string containing the help text (e.g. tooltip text) for the element. (Inherited from SLBase)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from SLBase)
Name	a string containing the UI Automation name for the element. (Inherited from SLBase)
PageCount	The count of the pages.
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the

Name	Description
	agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from SLBase)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)

Name	Description
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MoveToFirstPage	Moves the data pager to the first page.
MoveToLastPage	Moves the data pager to the last page.
MoveToNextPage	Moves the data pager to the next page.
MoveToPage	Moves the data pager to the given page.
MoveToPreviousPage	Moves the data pager to the previous page.
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
WaitForObject	<p>OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)</p> <p>Waits for an object that matches the specified locator. If no object matches within a timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code>. SLDatePicker Class

Description

Represents a control that allows the user to select a date.

Inheritance Hierarchy

- [SLBase](#)
 - SLDatePicker

Syntax

```
'Declaration
Public Class SLDatePicker _
Inherits SLBase
```

Properties

Name	Description
<i>AutomationId</i>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <i>SLBase</i>)
<i>ClassName</i>	the simple class name of the element. (Inherited from <i>SLBase</i>)
<i>ControlType</i>	a string containing the control type for the element. (Inherited from <i>SLBase</i>)
<i>HelpText</i>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <i>SLBase</i>)
<i>IsCalendarOpen</i>	a value whether the drop-down Calendar is open.
<i>IsEnabled</i>	a value that indicates whether the element is enabled. (Inherited from <i>SLBase</i>)
<i>Name</i>	a string containing the UI Automation name for the element. (Inherited from <i>SLBase</i>)
<i>SelectedDate</i>	the selected date or <i>Nothing</i> if no date is selected.
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. <i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRawChildren</i>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <i>SLBase</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)

Name	Description
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider

Name	Description
WaitForObject	increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SLGridSplitter Class

Description

Identifies a grid splitter control.

Inheritance Hierarchy

- [SLBase](#)
 - SLGridSplitter

Syntax

```
'Declaration
Public Class SLGridSplitter _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from SLBase)
ClassName	the simple class name of the element. (Inherited from SLBase)
ControlType	a string containing the control type for the element. (Inherited from SLBase)
HelpText	a string containing the help text (e.g. tooltip text) for the element. (Inherited from SLBase)

Name	Description
IsEnabled	a value that indicates whether the element is enabled. (Inherited from SLBase)
Name	a string containing the UI Automation name for the element. (Inherited from SLBase)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)

Name	Description
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRawChildren</i>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <i>SLBase</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>MoveHorizontal</i>	Moves the splitter horizontally.
<i>MoveVertical</i>	Moves the splitter vertically.
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)

Name	Description
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from SLBase)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)

Name	Description
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Select	Selects the header item.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)

Name	Description
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SLHorizontalScrollBar Class

Description

Identifies a horizontal scroll bar.

Inheritance Hierarchy

- [SLBase](#)
 - `SLHorizontalScrollBar`

Syntax

```
'Declaration
Public Class SLHorizontalScrollBar _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from SLBase)
ClassName	the simple class name of the element. (Inherited from SLBase)
ControlType	a string containing the control type for the element. (Inherited from SLBase)
HelpText	a string containing the help text (e.g. tooltip text) for the element. (Inherited from SLBase)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from SLBase)
Maximum	the maximum scroll position
Minimum	the minimum scroll position
Name	a string containing the UI Automation name for the element. (Inherited from SLBase)
ScrollPosition	the current scroll position
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)

Name	Description
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRawChildren</i>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <i>SLBase</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)

Name	Description
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Scroll	Scrolls the scroll bar by the specified amount
ScrollToMaximum	Scrolls the scroll bar to the right end.
ScrollToMinimum	Scrolls the scroll bar to the left end.
ScrollToPosition	Scrolls the scroll bar to the specific position
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use

Name	Description
	WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SLHyperlinkButton Class

Description

Identifies a hyperlink button control.

Inheritance Hierarchy

(Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SLListBox Class

Description

Identifies a list box control.

Inheritance Hierarchy

- [SLBase](#)
 - SLListBox

Syntax

```
'Declaration
Public Class SLListBox _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from SLBase)
CanSelectMultiple	whether the list box allows more than one child element to be selected concurrently.
ClassName	the simple class name of the element. (Inherited from SLBase)
ControlType	a string containing the control type for the element. (Inherited from SLBase)
HelpText	a string containing the help text (e.g. tooltip text) for the element. (Inherited from SLBase)
HorizontallyScrollable	a value that indicates whether the list box can scroll horizontally.
HorizontalScrollPercent	the current horizontal scroll position or negative one (-1) if there is no valid scroll position.
IsEnabled	a value that indicates whether the element is enabled. (Inherited from SLBase)
Items	the list of list box items.
ItemTexts	the list of all item texts.
Name	a string containing the UI Automation name for the element. (Inherited from SLBase)
SelectedIndex	the index of the first item in the current selection or returns negative one (-1) if the selection is empty.
SelectedIndices	the indices of the currently selected items. An empty list is returned if no items are currently selected.
SelectedItem	the first item in the current selection or returns <code>Nothing</code> if the selection is empty
SelectedItems	the currently selected items. An empty list is returned, if no items are currently selected.
SelectedItemText	the text of the first selected item.
SelectedItemTexts	the texts of the currently selected items. An empty list is returned if no items are currently selected.
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
VerticallyScrollable	a value that indicates whether the list box can scroll vertically.
VerticalScrollPercent	the current vertical scroll position or negative one (-1) if there is no valid scroll position.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location

Name	Description
	on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DeselectAll	Deselects all list items.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject . (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from SLBase)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)

Name	Description
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollHorizontal	Scrolls the currently visible region of the content area, horizontally, the specified ScrollAmount.
ScrollVertical	Scrolls the currently visible region of the content area, vertically, the specified ScrollAmount.
Select	Selects the given list box item.
SelectAll	Selects all items in the list.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetHorizontalScrollPercent	Sets the horizontal scroll position as a percentage of the total content area within the list box.
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
SetVerticalScrollPercent	Sets the vertical scroll position as a percentage of the total content area within the list box.
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)

Name	Description
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SLListItem Class

Description

Identifies a list item control.

Inheritance Hierarchy

- [SLBase](#)
 - SLListItem

Syntax

```
'Declaration  
Public Class SLListItem _  
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from SLBase)
ClassName	the simple class name of the element. (Inherited from SLBase)
ControlType	a string containing the control type for the element. (Inherited from SLBase)
HelpText	a string containing the help text (e.g. tooltip text) for the element. (Inherited from SLBase)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from SLBase)
IsSelected	a value that indicates whether the list item is selected
Name	a string containing the UI Automation name for the element. (Inherited from SLBase)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)

Name	Description
Click	Clicks on the object. (Inherited from IClickable)
Deselect	Deselects the item.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from SLBase)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)

Name	Description
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scroll the list item into view.
Select	Selects the list item.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SLMenuBar Class

Description

Identifies a menu bar control.

Inheritance Hierarchy

- [SLBase](#)
 - SLMenuBar

Syntax

```
'Declaration
Public Class SLMenuBar _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from SLBase)
ClassName	the simple class name of the element. (Inherited from SLBase)
ControlType	a string containing the control type for the element. (Inherited from SLBase)
HelpText	a string containing the help text (e.g. tooltip text) for the element. (Inherited from SLBase)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from SLBase)
Name	a string containing the UI Automation name for the element. (Inherited from SLBase)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)

Name	Description
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from SLBase)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SLMenuItem Class

Description

Identifies a menu item control.

Inheritance Hierarchy

- [SLBase](#)
 - SLMenuItem

Syntax

```
'Declaration
Public Class SLMenuItem _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from SLBase)
ClassName	the simple class name of the element. (Inherited from SLBase)
ControlType	a string containing the control type for the element. (Inherited from SLBase)
HelpText	a string containing the help text (e.g. tooltip text) for the element. (Inherited from SLBase)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from SLBase)
Name	a string containing the UI Automation name for the element. (Inherited from SLBase)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from SLBase)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)

Name	Description
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)

Name	Description
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . An exception is thrown if the timeout is reached. (Inherited from TestObject)

SLPane Class

Description

Identifies a pane that can optionally have scroll bars.

Inheritance Hierarchy

- [SLBase](#)
 - SLPane

Syntax

```
'Declaration
Public Class SLPane _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from SLBase)
ClassName	the simple class name of the element. (Inherited from SLBase)
ControlType	a string containing the control type for the element. (Inherited from SLBase)
HelpText	a string containing the help text (e.g. tooltip text) for the element. (Inherited from SLBase)
HorizontallyScrollable	a value that indicates whether the pane can scroll horizontally.
HorizontalScrollPercent	the current horizontal scroll position or negative one (-1) if there is no valid scroll position.
IsEnabled	a value that indicates whether the element is enabled. (Inherited from SLBase)
Name	a string containing the UI Automation name for the element. (Inherited from SLBase)

Name	Description
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
VerticallyScrollable	a value that indicates whether the pane can scroll vertically.
VerticalScrollPercent	the current vertical scroll position or negative one (-1) if there is no valid scroll position.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)

Name	Description
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRawChildren</i>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <i>SLBase</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ScrollHorizontal</i>	Scrolls the currently visible region of the content area, horizontally, the specified <i>ScrollAmount</i> .
<i>ScrollVertical</i>	Scrolls the currently visible region of the content area, vertically, the specified <i>ScrollAmount</i> .
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)

Name	Description
<i>SetHorizontalScrollPercent</i>	Sets the horizontal scroll position as a percentage of the total content area within the pane.
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>SetVerticalScrollPercent</i>	Sets the vertical scroll position as a percentage of the total content area within the pane.
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout

Name	Description
	specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SLPasswordBox Class

Description

Identifies a password box control.

Inheritance Hierarchy

- [SLBase](#)
 - SLPasswordBox

Syntax

```
'Declaration
Public Class SLPasswordBox _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from SLBase)
ClassName	the simple class name of the element. (Inherited from SLBase)
ControlType	a string containing the control type for the element. (Inherited from SLBase)
HelpText	a string containing the help text (e.g. tooltip text) for the element. (Inherited from SLBase)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from SLBase)
IsReadOnly	whether the password box is read-only
Name	a string containing the UI Automation name for the element. (Inherited from SLBase)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Clear	Removes all text from the password field.
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from SLBase)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)

Name	Description
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject . (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetPosition	Sets the insertion point in the password field.
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
SetSelection	Selects a range of text in the password box.
SetText	Replaces the text in the password field with the given text.
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)

Name	Description
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SLPopup Class

Description

Identifies a popup control. Context menus are also treated as popup controls.

Inheritance Hierarchy

- [SLBase](#)
 - SLPopup

Syntax

```
'Declaration
Public Class SLPopup _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from SLBase)
ClassName	the simple class name of the element. (Inherited from SLBase)
ControlType	a string containing the control type for the element. (Inherited from SLBase)
HelpText	a string containing the help text (e.g. tooltip text) for the element. (Inherited from SLBase)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from SLBase)
Name	a string containing the UI Automation name for the element. (Inherited from SLBase)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)

Name	Description
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRawChildren</i>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <i>SLBase</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)

Name	Description
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)

(Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)

Name	Description
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRawChildren</i>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <i>SLBase</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)

Name	Description
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Select	Clicks the button.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SLRichTextBox Class

Description

Identifies a rich text box control.

Inheritance Hierarchy

- [SLBase](#)
 - SLRichTextBox

Syntax

```
'Declaration
Public Class SLRichTextBox _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from SLBase)
ClassName	the simple class name of the element. (Inherited from SLBase)
ControlType	a string containing the control type for the element. (Inherited from SLBase)
HelpText	a string containing the help text (e.g. tooltip text) for the element. (Inherited from SLBase)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from SLBase)
Name	a string containing the UI Automation name for the element. (Inherited from SLBase)
SelectedText	the selected text
Text	The text of the control. (Inherited from TestObject)

Name	Description
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Clear	Removes all text from the text box.
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as

Name	Description
	children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <i>SLBase</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetPosition</i>	Sets the insertion point in the text box.
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>SetSelection</i>	Selects a range of text in the text box.
<i>SetText</i>	Replaces the content in the text box with the given text.
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)

Name	Description
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SLSeparator Class

Description

Identifies a separator control.

Inheritance Hierarchy

- [SLBase](#)
 - SLSeparator

Syntax

```
'Declaration  
Public Class SLSeparator _  
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from SLBase)
ClassName	the simple class name of the element. (Inherited from SLBase)

The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SLSlider Class

Description

Identifies a progress bar control.

Inheritance Hierarchy

- [SLBase](#)
 - SLSlider

Syntax

```
'Declaration
Public Class SLSlider _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from SLBase)
ClassName	the simple class name of the element. (Inherited from SLBase)

Name	Description
ControlType	a string containing the control type for the element. (Inherited from SLBase)
HelpText	a string containing the help text (e.g. tooltip text) for the element. (Inherited from SLBase)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from SLBase)
LargeChange	the value that is added to or subtracted from the Value property when a large change is made, such as with the PAGE DOWN key.
Maximum	the maximum progress value
Minimum	the minimum progress value
Name	a string containing the UI Automation name for the element. (Inherited from SLBase)
SmallChange	the value that is added to or subtracted from the Value property when a small change is made, such as with an arrow key.
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DecreaseLarge	Decreases the value of the Slider by a large amount.
DecreaseSmall	Decreases the value of the Slider by a small amount.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)

Name	Description
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from SLBase)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
IncreaseLarge	Increases the value of the Slider by a large amount.
IncreaseSmall	Increases the value of the Slider by a small amount.
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)

Name	Description
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
SetValue	Sets the value of the slider
SetValueToMaximum	Sets the Slider to the maximum position.
SetValueToMinimum	Sets the Slider to the minimum position.
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider

Name	Description
<i>WaitForObject</i>	increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

SLSpinner Class

Description

Identifies a spinner control.

A spinner control type consists of a set of buttons that enable a user to select from a set of items or set a numerical value from within a range.

Inheritance Hierarchy

- *SLBase*
 - SLSpinner

Syntax

```
'Declaration
Public Class SLSpinner _
Inherits SLBase
```

Properties

Name	Description
<i>AutomationId</i>	a string containing the UI Automation identifier (ID) for the element. (Inherited from <i>SLBase</i>)
<i>ClassName</i>	the simple class name of the element. (Inherited from <i>SLBase</i>)
<i>ControlType</i>	a string containing the control type for the element. (Inherited from <i>SLBase</i>)

Name	Description
HelpText	a string containing the help text (e.g. tooltip text) for the element. (Inherited from SLBase)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from SLBase)
Name	a string containing the UI Automation name for the element. (Inherited from SLBase)
NumericValue	the current numeric value of the spinner
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)

Name	Description
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRawChildren</i>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <i>SLBase</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)

Name	Description
 SetProperty 	Sets the value of the specified property. (Inherited from TestObject)
 TextCapture 	Returns the text in this object's visible area. (Inherited from TestObject)
 TextClick 	Clicks in the center of the specified text. (Inherited from TestObject)
 TextExists 	Returns whether the specified text exists. (Inherited from TestObject)
 TextRectangle 	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
 TypeKeys 	Sends a set of keystrokes to the object. (Inherited from IKeyable)
 TypePasswordKeys 	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
 WaitForChildDisappearance 	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForDisappearance 	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForObject 	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
 WaitForProperty 	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForPropertyNotEquals 	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForScreenshotStable 	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If

Name	Description
	you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SLSplitButton Class

Description

Identifies a split button control.

Inheritance Hierarchy

- [SLBase](#)
 - SLSplitButton

Syntax

```
'Declaration
Public Class SLSplitButton _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from SLBase)
ClassName	the simple class name of the element. (Inherited from SLBase)
ControlType	a string containing the control type for the element. (Inherited from SLBase)
HelpText	a string containing the help text (e.g. tooltip text) for the element. (Inherited from SLBase)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from SLBase)
Name	a string containing the UI Automation name for the element. (Inherited from SLBase)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored

Name	Description
	in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this <code>TestObject</code> . (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from SLBase)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)

Name	Description
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

Name	Description
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SLTabControl Class

Description

Identifies a tab control.

Inheritance Hierarchy

- [SLBase](#)
 - SLTabControl

Syntax

```
'Declaration
Public Class SLTabControl _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from SLBase)
ClassName	the simple class name of the element. (Inherited from SLBase)
ControlType	a string containing the control type for the element. (Inherited from SLBase)
HelpText	a string containing the help text (e.g. tooltip text) for the element. (Inherited from SLBase)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from SLBase)
Items	a complete list of tab items.
ItemTexts	a complete list of tab item texts.
Name	a string containing the UI Automation name for the element. (Inherited from SLBase)
SelectedIndex	the index of the selected item or negative one (-1) if the selection is empty.
SelectedItem	the selected item or <code>Nothing</code> if the selection is empty.

Name	Description
SelectedItemText	the text of the selected item or an empty string if the selection is empty.
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)

GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)

Name	Description
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from SLBase)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Select	Selects an item in the tab control.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)

Name	Description
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

SLSLItem Class

Description

Identifies a tab item control.

Inheritance Hierarchy

- [SLBase](#)
 - SLSLItem

Syntax

```
'Declaration  
Public Class SLSLItem _  
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from SLBase)
ClassName	the simple class name of the element. (Inherited from SLBase)
ControlType	a string containing the control type for the element. (Inherited from SLBase)
HelpText	a string containing the help text (e.g. tooltip text) for the element. (Inherited from SLBase)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from SLBase)
IsSelected	a value that indicates whether the tab item is selected
Name	a string containing the UI Automation name for the element. (Inherited from SLBase)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)

Name	Description
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from SLBase)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)

Name	Description
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Select	Selects the tab item.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForObject	Waits for an object that matches the specified locator. If no object matches within a timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SLTable Class

Description

Identifies a table.

Inheritance Hierarchy

- [SLBase](#)
 - SLTable

Syntax

```
'Declaration
Public Class SLTable _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from SLBase)
ClassName	the simple class name of the element. (Inherited from SLBase)
ControlType	a string containing the control type for the element. (Inherited from SLBase)
HelpText	a string containing the help text (e.g. tooltip text) for the element. (Inherited from SLBase)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from SLBase)
Name	a string containing the UI Automation name for the element. (Inherited from SLBase)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)

An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider

Name	Description
WaitForObject	increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Examples

```
textBox.SetText("some text")
textBox.SetSelection(0, 4) ' selects 4 characters starting from the first one
textBox.TypeKeys("<Ctrl+C>") ' copies the selected text to the clipboard
Dim selectedText = Clipboard.GetText() ' gets the text from the clipboard
```

SLThumb Class

Description

Identifies a thumb control.

Inheritance Hierarchy

- [SLBase](#)
 - SLThumb

Syntax

```
'Declaration
Public Class SLThumb _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from SLBase)
ClassName	the simple class name of the element. (Inherited from SLBase)

Name	Description
<i>ControlType</i>	a string containing the control type for the element. (Inherited from <i>SLBase</i>)
<i>HelpText</i>	a string containing the help text (e.g. tooltip text) for the element. (Inherited from <i>SLBase</i>)
<i>IsEnabled</i>	a value that indicates whether the element is enabled. (Inherited from <i>SLBase</i>)
<i>Name</i>	a string containing the UI Automation name for the element. (Inherited from <i>SLBase</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)

If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <i>TestObject</i>)

Name	Description
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRawChildren</i>	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from <i>SLBase</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)

Name	Description
 SetProperty 	Sets the value of the specified property. (Inherited from TestObject)
 TextCapture 	Returns the text in this object's visible area. (Inherited from TestObject)
 TextClick 	Clicks in the center of the specified text. (Inherited from TestObject)
 TextExists 	Returns whether the specified text exists. (Inherited from TestObject)
 TextRectangle 	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
 TypeKeys 	Sends a set of keystrokes to the object. (Inherited from IKeyable)
 TypePasswordKeys 	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
 WaitForChildDisappearance 	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForDisappearance 	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForObject 	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
 WaitForProperty 	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForPropertyNotEquals 	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForScreenshotStable 	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If

Name	Description
	you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SLTitleBar Class

Description

Identifies the caption bar on a window.

Inheritance Hierarchy

- [SLBase](#)
 - SLTitleBar

Syntax

```
'Declaration
Public Class SLTitleBar _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from SLBase)
ClassName	the simple class name of the element. (Inherited from SLBase)
ControlType	a string containing the control type for the element. (Inherited from SLBase)
HelpText	a string containing the help text (e.g. tooltip text) for the element. (Inherited from SLBase)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from SLBase)
Name	a string containing the UI Automation name for the element. (Inherited from SLBase)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored

Name	Description
	in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this <code>TestObject</code> . (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from SLBase)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)

Name	Description
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

Name	Description
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SLToggleButton Class

Description

Identifies a toggle button control.

Inheritance Hierarchy

- [SLBase](#)
 - SLToggleButton

Syntax

```
'Declaration
Public Class SLToggleButton _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from SLBase)
ClassName	the simple class name of the element. (Inherited from SLBase)
ControlType	a string containing the control type for the element. (Inherited from SLBase)
HelpText	a string containing the help text (e.g. tooltip text) for the element. (Inherited from SLBase)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from SLBase)
Name	a string containing the UI Automation name for the element. (Inherited from SLBase)
Text	The text of the control. (Inherited from TestObject)
ToggleState	the toggle state of the button
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)

Name	Description
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from SLBase)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)

Name	Description
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
Toggle	Cycles through the toggle states of the button in this order: On, Off and, if supported, Indeterminate.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from SLBase)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SLTreeView Class

Description

Represents a control that displays hierarchical data in a tree structure that has items that can expand and collapse.

Inheritance Hierarchy

- [SLBase](#)
 - SLTreeView

Syntax

```
'Declaration
Public Class SLTreeView _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from SLBase)
ClassName	the simple class name of the element. (Inherited from SLBase)
ControlType	a string containing the control type for the element. (Inherited from SLBase)
HelpText	a string containing the help text (e.g. tooltip text) for the element. (Inherited from SLBase)
HorizontallyScrollable	a value that indicates whether the tree view can scroll horizontally.
HorizontalScrollPercent	the current horizontal scroll position or negative one (-1) if there is no valid scroll position.
IsEnabled	a value that indicates whether the element is enabled. (Inherited from SLBase)
Name	a string containing the UI Automation name for the element. (Inherited from SLBase)

Name	Description
RootItems	a complete list of all root tree items.
RootItemTexts	a complete list of the texts of all root tree items.
SelectedItem	the selected item or returns <code>Nothing</code> if the selection is empty.
SelectedItemPath	the selected item path or an empty item path if nothing is selected
SelectedItemText	the text of the selected item or an empty string if the selection is empty.
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
VerticallyScrollable	a value that indicates whether the tree view can scroll vertically.
VerticalScrollPercent	the current vertical scroll position or negative one (-1) if there is no valid scroll position.
VisibleItemPaths	the visible items in the tree as item paths.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
Collapse	Collapses the specified item.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Expand	Expands the specified item.
ExpandAll	Expands all items in the tree.
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)

Name	Description
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from SLBase)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollHorizontal	Scrolls the currently visible region of the content area, horizontally, the specified ScrollAmount.
ScrollVertical	Scrolls the currently visible region of the content area, vertically, the specified ScrollAmount.
Select	Selects the specified item.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetHorizontalScrollPercent	Sets the horizontal scroll position as a percentage of the total content area within the tree view.
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
SetVerticalScrollPercent	Sets the vertical scroll position as a percentage of the total content area within the tree view.
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object,

Name	Description
	for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SLTreeViewItem Class

Description

Represents a selectable item in a tree control.

Inheritance Hierarchy

- [SLBase](#)
 - SLTreeViewItem

Syntax

```
'Declaration
Public Class SLTreeViewItem _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from SLBase)
ClassName	the simple class name of the element. (Inherited from SLBase)
ControlType	a string containing the control type for the element. (Inherited from SLBase)

Name	Description
HelpText	a string containing the help text (e.g. tooltip text) for the element. (Inherited from SLBase)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from SLBase)
IsExpanded	a value that indicates whether the nested items in a tree item are expanded or collapsed.
IsLeaf	a value that indicates whether the tree view item is a leaf item.
IsSelected	a value that indicates whether a tree item is selected.
Items	a complete list of items.
ItemTexts	a complete list of item texts.
Name	a string containing the UI Automation name for the element. (Inherited from SLBase)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
Collapse	Collapses the item.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Expand	Expands the item.
ExpandSubTree	Expands the sub tree under this tree item.
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)

Name	Description
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from SLBase)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the tree item into view
Select	Selects the item.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)

Name	Description
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from SLBase)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)

Name	Description
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Scroll	Scrolls the scroll bar by the specified amount
ScrollToMaximum	Scrolls the scroll bar to the bottom.
ScrollToMinimum	Scrolls the scroll bar to the top.
ScrollToPosition	Scrolls the scroll bar to the specific position
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForObject	Waits for an object that matches the specified locator. If no object matches within a timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SLWindow Class

Description

Identifies a window control.

Inheritance Hierarchy

- [SLBase](#)
 - SLWindow

Syntax

```
'Declaration
Public Class SLWindow _
Inherits SLBase
```

Properties

Name	Description
AutomationId	a string containing the UI Automation identifier (ID) for the element. (Inherited from SLBase)
ClassName	the simple class name of the element. (Inherited from SLBase)
ControlType	a string containing the control type for the element. (Inherited from SLBase)
HelpText	a string containing the help text (e.g. tooltip text) for the element. (Inherited from SLBase)
IsEnabled	a value that indicates whether the element is enabled. (Inherited from SLBase)
Name	a string containing the UI Automation name for the element. (Inherited from SLBase)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
Close	Closes the window.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)

Name	Description
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRawChildren	Gets the raw child element of this element. This method can be used to access elements that would otherwise not be recognized as children. Optionally one of the MSUIA control types can be specified to only return children of a certain type. (Inherited from SLBase)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the window.
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Java AWT and Swing Class Reference

Lists the available classes for testing Java AWT and Swing controls.

AbstractButton Class

Description

Defines common behaviors for buttons and menu items.

Inheritance Hierarchy

- [JComponent](#)
 - AbstractButton
 - [JButton](#)
 - [JMenuItem](#)
 - [JToggleButton](#)

Syntax

```
'Declaration
Public Class AbstractButton _
Inherits JComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)

Name	Description
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
ToolTipText	the tool tip text of a Swing component. (Inherited from JComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)

Name	Description
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)

Name	Description
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
Select	Selects the button.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Applet Class

Description

Represents the Java Applet in the browser.

Inheritance Hierarchy

- [AWTContainer](#)
 - Applet

Syntax

```
'Declaration
Public Class Applet _
Inherits AWTContainer
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)

Name	Description
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. Name	Description
	you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

AppletContainer Class

Description

Root element of an Applet in the browser.

Inheritance Hierarchy

- [AWTContainer](#)
 - AppletContainer

Syntax

```
'Declaration
Public Class AppletContainer _
Inherits AWTContainer
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)

Name	Description
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)

Name	Description
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

AWTButton Class

Description

Represents a push button.

Inheritance Hierarchy

- [AWTComponent](#)
 - AWTButton

Syntax

```
'Declaration  
Public Class AWTButton _  
Inherits AWTComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)

Name	Description
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>OpenContextMenu</i>	Opens a context menu at the specified position. (Inherited from <i>AWTComponent</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ScrollIntoView</i>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <i>AWTComponent</i>)
<i>Select</i>	Selects the button.
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)

Name	Description
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

AWTCanvas Class

Description

Represents an empty rectangular area of the screen where the application can draw or trap events from the user.

Inheritance Hierarchy

- [AWTComponent](#)

- `AWTCanvas`

Syntax

```
'Declaration
Public Class AWTCanvas _
Inherits AWTComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. <i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)

Name	Description
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
Toggle	Toggles the check box state.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
Uncheck	Unchecks the check box.
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown.

Name	Description
	The default timeout is 5 seconds and you can change the timeout by setting the value of the option <i>OPT_WAIT_RESOLVE_OBJDEF</i> . Use <i>WaitForObject</i> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <i>WaitForObject</i> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <i>WaitForObject</i> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <i>OPT_WAIT_RESOLVE_OBJDEF</i> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <i>OPT_WAIT_RESOLVE_OBJDEF</i> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <i>OPT_WAIT_RESOLVE_OBJDEF</i> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

AWTCheckboxMenuItem Class

Description

Represents a check box control that can be inserted in a menu item.

Inheritance Hierarchy

- *AWTMenuItem*
 - AWTCheckboxMenuItem

Syntax

```
'Declaration
Public Class AWTCheckboxMenuItem _
Inherits AWTMenuItem
```

Properties

Name	Description
<i>AccessibleName</i>	The accessible name of the component. (Inherited from <i>AWTMenuItem</i>)
<i>Checked</i>	whether the check box of the menu item is checked.

Name	Description
Enabled	Whether the menu item is enabled. (Inherited from AWTMenuItem)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Check	Checks the check box of the menu item.
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)

Name	Description
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>Select</i>	Selects the menu item. (Inherited from <i>AWTMenuItem</i>)
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)

Name	Description
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
Toggle	Toggles the check box state of the menu item.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
Uncheck	Unchecks the check box of the menu item.
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

AWTChoice Class

Description

Represents a combo box.

Inheritance Hierarchy

- [AWTComponent](#)
 - AWTChoice

Syntax

```
'Declaration
Public Class AWTChoice _
Inherits AWTComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
ItemCount	the number of items in the combo box.
Items	the list of combo box items.
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
SelectedIndex	the index of the selected item. -1 (4Test: 0) is returned, if no item is currently selected.
SelectedItem	the selected item. NULL is returned, if no item is currently selected.
Text	The text of the control. (Inherited from TestObject)

Name	Description
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetItem	Returns the item at the specified index.
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
Select	Selects the specified item in the combo box.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)

Name	Description
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

AWTComponent Class

Description

AWTComponent is the base class for Java AWT.

Inheritance Hierarchy

WaitForPropertyNotEquals	<p>Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)</p>
WaitForScreenshotStable	<p>Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)</p>

AWTDialog Class

Description

Represents a dialog box.

Inheritance Hierarchy

- [AWTWindow](#)
 - AWTDialog
 - [JDialog](#)

Syntax

```
'Declaration  
Public Class AWTDialog _  
Inherits AWTWindow
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Modal	whether the dialog is modal.
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Resizable	whether the dialog is resizable by the user.
Text	The text of the control. (Inherited from TestObject)
Title	the title of the dialog.
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)
WindowState	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from IMoveable)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored

Name	Description
	in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
Close	Closes the window. (Inherited from IMoveable)
CloseSynchron	Closes the window and waits until the window is closed. (Inherited from IMoveable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetCloseWindows	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from IMoveable)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject . (Inherited from TestObject)
GetFocus	Returns the object with the input focus. (Inherited from IMoveable)
GetNextCloseWindow	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from IMoveable)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)

Name	Description
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsActive	Returns whether the window is set to active. (Inherited from IMoveable)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
Maximize	Maximizes the window. (Inherited from IMoveable)
Minimize	Reduces the window to an icon. (Inherited from IMoveable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the window. (Inherited from IMoveable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Restore	Restores the window to its previous size. (Inherited from IMoveable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
SetActive	Makes the window active. (Inherited from IMoveable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)

Name	Description
 SetProperty 	Sets the value of the specified property. (Inherited from TestObject)
 Size 	Resizes the window. (Inherited from IMoveable)
 TextCapture 	Returns the text in this object's visible area. (Inherited from TestObject)
 TextClick 	Clicks in the center of the specified text. (Inherited from TestObject)
 TextExists 	Returns whether the specified text exists. (Inherited from TestObject)
 TextRectangle 	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
 TypeKeys 	Sends a set of keystrokes to the object. (Inherited from IKeyable)
 TypePasswordKeys 	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
 WaitForChildDisappearance 	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForDisappearance 	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForObject 	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
 WaitForProperty 	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForPropertyNotEquals 	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

AWTFrame Class

Description

Represents a top-level window with a title and a border.

Inheritance Hierarchy

- [AWTWindow](#)
 - AWTFrame
 - [JFrame](#)

Syntax

```
'Declaration
Public Class AWTFrame _
Inherits AWTWindow
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)

Name	Description
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Resizable	whether the frame is resizable by the user.
Text	The text of the control. (Inherited from TestObject)
Title	the title of the frame.
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)
WindowState	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from IMoveable)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
Close	Closes the window. (Inherited from IMoveable)
CloseSynchron	Closes the window and waits until the window is closed. (Inherited from IMoveable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)

Name	Description
GetCloseWindows	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from IMoveable)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetFocus	Returns the object with the input focus. (Inherited from IMoveable)
GetNextCloseWindow	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from IMoveable)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsActive	Returns whether the window is set to active. (Inherited from IMoveable)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
Maximize	Maximizes the window. (Inherited from IMoveable)
Minimize	Reduces the window to an icon. (Inherited from IMoveable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)

Name	Description
Move	Moves the window. (Inherited from IMoveable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Restore	Restores the window to its previous size. (Inherited from IMoveable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
SetActive	Makes the window active. (Inherited from IMoveable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
Size	Resizes the window. (Inherited from IMoveable)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

AWTHorizontalScrollbar Class

Description

Represents a horizontal scroll bar.

Inheritance Hierarchy

- [AWTScrollbar](#)
 - AWTHorizontalScrollbar

Syntax

```
'Declaration
Public Class AWTHorizontalScrollbar _
Inherits AWTScrollbar
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
PageSize	the block increment value of the scroll bar. (Inherited from IAWTScroller)
Position	the current position of the scroll bar. (Inherited from IAWTScroller)
Range	the range value of the scroll bar. (Inherited from IAWTScroller)
StepSize	the unit increment value of the scroll bar. (Inherited from IAWTScroller)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant

Name	Description
	<i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject . (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)

Name	Description
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
Page	Increments the current scroll position by specified number of pages. (Inherited from IAWTScroller)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
ScrollTo	Scrolls to the specified position. (Inherited from IAWTScroller)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
Step	Increments the current scroll position by specified steps. (Inherited from IAWTScroller)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
WaitForDisappearance	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject) Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

AWTLabel Class

Description

Represents a class for placing text in a container.

Inheritance Hierarchy

- [AWTComponent](#)
 - AWTLabel

Syntax

```
'Declaration  
Public Class AWTLabel _  
Inherits AWTComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Alignment	the alignment of the label.
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)

Name	Description
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)

GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)

Name	Description
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>OpenContextMenu</i>	Opens a context menu at the specified position. (Inherited from <i>AWTComponent</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ScrollIntoView</i>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <i>AWTComponent</i>)
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

Name	Description
WaitForObject	Waits for an object that matches the specified locator. If no object matches within a timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

AWTList Class

Description

Represents a list box.

Inheritance Hierarchy

- [AWTComponent](#)
 - AWTList

Syntax

```
'Declaration
Public Class AWTList _
Inherits AWTComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
ItemCount	the number of list items.
Items	a list of items in the list.
MultipleMode	whether the list allows multiple selection.
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
SelectedIndex	the index of the currently selected item. -1 (4Test: 0) is returned, if no item is currently selected.
SelectedIndices	the indices of the currently selected items. An empty list is returned, if no items are currently selected.
SelectedItem	the currently selected list item. NULL is returned, if no item is currently selected.
SelectedItems	the currently selected list items. An empty list is returned, if no items are currently selected.
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
Deselect	Deselects the specified list item.
DeselectAll	Deselects all list items.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DoubleClickItem	Double-clicks a list item.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetItem	Returns the list item at the specified index.
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)

Name	Description
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>OpenContextMenu</i>	Opens a context menu at the specified position. (Inherited from <i>AWTComponent</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ScrollIntoView</i>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <i>AWTComponent</i>)
<i>Select</i>	Selects the specified item.
<i>SelectAll</i>	Selects all items in the list.
<i>SelectRange</i>	Selects all items within the specified range.
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)

Name	Description
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

AWTMenu Class

Description

Represents a menu component that is accessed from a menu bar.

Inheritance Hierarchy

- [AWTMenuItem](#)
 - AWTMenu

Syntax

```
'Declaration  
Public Class AWTMenu _  
Inherits AWTMenuItem
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTMenuItem)
Enabled	Whether the menu item is enabled. (Inherited from AWTMenuItem)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)

The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

AWTMenuItem Class

Description

Represents a menu item.

Inheritance Hierarchy

- [AWTMenuComponent](#)
 - AWTMenuItem
 - [AWTCheckboxMenuItem](#)
 - [AWTMenu](#)

Syntax

```
'Declaration
Public Class AWTMenuItem _
Inherits AWTMenuComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component.
Enabled	Whether the menu item is enabled.
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)

HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Select	Selects the menu item.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)

Name	Description
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

AWTRadioButton Class

Description

Represents a radio button.

Inheritance Hierarchy

- [AWTComponent](#)
 - AWTRadioButton

Syntax

```
'Declaration  
Public Class AWTRadioButton _  
Inherits AWTComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Checked	Whether the radio button is checked.
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Check	Checks the radio button.
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject . (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)

Name	Description
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>OpenContextMenu</i>	Opens a context menu at the specified position. (Inherited from <i>AWTComponent</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ScrollIntoView</i>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <i>AWTComponent</i>)
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)

Name	Description
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

AWTScrollbar Class

Description

Represents a scroll bar. This class includes scroll bars that are parts of controls, such as the scroll bar on a list box.

Inheritance Hierarchy

- [AWTComponent](#)

- `AWTScrollbar`
 - `AWTHorizontalScrollbar`
 - `AWTVerticalScrollbar`

Syntax

```
'Declaration
Public Class AWTScrollbar _
Inherits AWTComponent _
Implements IAWTScroller
```

Properties

Name	Description
<code>AccessibleName</code>	The accessible name of the component. (Inherited from <code>AWTComponent</code>)
<code>AccessibleRole</code>	The accessible role of the component. (Inherited from <code>AWTComponent</code>)
<code>Background</code>	The background color of the component. (Inherited from <code>AWTComponent</code>)
<code>Cursor</code>	The name of the cursor set in the component. (Inherited from <code>AWTComponent</code>)
<code>Enabled</code>	whether the component is enabled. (Inherited from <code>AWTComponent</code>)
<code>Focusable</code>	whether the component can be focused. (Inherited from <code>AWTComponent</code>)
<code>Font</code>	The font of the component. (Inherited from <code>AWTComponent</code>)
<code>Foreground</code>	The foreground color of the component. (Inherited from <code>AWTComponent</code>)
<code>Height</code>	The current height of the component. (Inherited from <code>AWTComponent</code>)
<code>Name</code>	The name of the component. (Inherited from <code>AWTComponent</code>)
<code>NativeHandle</code>	The native window handle for the object. (Inherited from <code>INativeWindow</code>)
<code>PageSize</code>	the block increment value of the scroll bar. (Inherited from <code>IAWTScroller</code>)
<code>Position</code>	the current position of the scroll bar. (Inherited from <code>IAWTScroller</code>)
<code>Range</code>	the range value of the scroll bar. (Inherited from <code>IAWTScroller</code>)
<code>StepSize</code>	the unit increment value of the scroll bar. (Inherited from <code>IAWTScroller</code>)
<code>Text</code>	The text of the control. (Inherited from <code>TestObject</code>)
<code>Value</code>	The value of the control, e.g.: text in a text control. (Inherited from <code>TestObject</code>)
<code>Width</code>	The current width of the component. (Inherited from <code>AWTComponent</code>)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)

Name	Description
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>OpenContextMenu</i>	Opens a context menu at the specified position. (Inherited from <i>AWTComponent</i>)
<i>Page</i>	Increments the current scroll position by specified number of pages. (Inherited from <i>IAWTScroller</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ScrollIntoView</i>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <i>AWTComponent</i>)
<i>ScrollTo</i>	Scrolls to the specified position. (Inherited from <i>IAWTScroller</i>)
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>Step</i>	Increments the current scroll position by specified steps. (Inherited from <i>IAWTScroller</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)

Name	Description
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

AWTScrollPane Class

Description

Represents a class that implements automatic horizontal or vertical scrolling for a single child component.

Inheritance Hierarchy

- [AWTContainer](#)
 - AWTScrollPane

Syntax

```
'Declaration
Public Class AWTScrollPane _
Inherits AWTContainer _
Implements IAWTScrollable
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Position	the current scroll position of the scrollable component. (Inherited from IAWTScrollable)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location

Name	Description
	<p>on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)</p>
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject . (Inherited from TestObject)
GetHorizontalBar	Gets the horizontal scroll bar. (Inherited from IAWTScrollable)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetVerticalBar	Gets the vertical scroll bar. (Inherited from IAWTScrollable)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)

Name	Description
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
ScrollTo	Scrolls to the specified position. (Inherited from IAWTScrollable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)

Name	Description
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

AWTTextArea Class

Description

Represents a text area.

Inheritance Hierarchy

- [AWTTextComponent](#)
 - AWTTextArea

Syntax

```
'Declaration
Public Class AWTTextArea _
Inherits AWTTextComponent _
Implements IAWTScrollable
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
CaretPosition	the position of the text insertion caret for the text component. (Inherited from AWTTextComponent)
Columns	the number of columns in the text area.
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Editable	whether the text of the text component can be changed by the user. (Inherited from AWTTextComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Position	the current scroll position of the scrollable component. (Inherited from IAWTScrollable)
Rows	The number of rows in the text area.
SelectedText	the current selected text. (Inherited from AWTTextComponent)
SelectionEnd	the end position of the selected text. (Inherited from AWTTextComponent)
SelectionStart	the start position of the selected text. (Inherited from AWTTextComponent)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Name	Description
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Clear	Removes all the text from the text component. (Inherited from AWTTextComponent)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetHorizontalBar	Gets the horizontal scroll bar. (Inherited from IAWTScrollable)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetVerticalBar	Gets the vertical scroll bar. (Inherited from IAWTScrollable)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Insert	Inserts the specified text at the specified position.
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReplaceRange	Replaces text between the specified start and end positions with the specified replacement text.
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
ScrollTo	Scrolls to the specified position. (Inherited from IAWTScrollable)
SelectAll	Selects all the text in the text component. (Inherited from AWTTextComponent)

Name	Description
SetCaretPosition	Sets the position of the text insertion caret for this text component. (Inherited from AWTTextComponent)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
SetSelectionRange	Selects the text within the specified range. (Inherited from AWTTextComponent)
SetText	Sets the text of the text component to the specified text. (Inherited from AWTTextComponent)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

AWTTextComponent Class

Description

Represents the base class for the AWTTextField and AWTTextArea classes.

Inheritance Hierarchy

- [AWTComponent](#)
 - AWTTextComponent
 - [AWTTextArea](#)
 - [AWTTextField](#)

Syntax

```
'Declaration
Public Class AWTTextComponent _
Inherits AWTComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
CaretPosition	the position of the text insertion caret for the text component.
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Editable	whether the text of the text component can be changed by the user.
Enabled	whether the component is enabled. (Inherited from AWTComponent)

Name	Description
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
SelectedText	the current selected text.
SelectionEnd	the end position of the selected text.
SelectionStart	the start position of the selected text.
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Clear	Removes all the text from the text component.
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)

Name	Description
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
SelectAll	Selects all the text in the text component.
SetCaretPosition	Sets the position of the text insertion caret for this text component.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
SetSelectionRange	Selects the text within the specified range.
SetText	Sets the text of the text component to the specified text.
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a

Name	Description
	WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

AWTTextField Class

Description

Represents single-line and multi-line text field controls whose text can be modified by the user.

Inheritance Hierarchy

- [AWTTextComponent](#)
 - AWTTextField

Syntax

```
'Declaration
Public Class AWTTextField _
Inherits AWTTextComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)

Name	Description
<i>CaretPosition</i>	the position of the text insertion caret for the text component. (Inherited from <i>AWTTextComponent</i>)
<i>Cursor</i>	The name of the cursor set in the component. (Inherited from <i>AWTComponent</i>)
<i>EchoChar</i>	the character that is displayed instead of the characters that are actually typed.
<i>EchoCharSet</i>	whether <i>EchoChar</i> is set to a value other than 0.
<i>Editable</i>	whether the text of the text component can be changed by the user. (Inherited from <i>AWTTextComponent</i>)
<i>Enabled</i>	whether the component is enabled. (Inherited from <i>AWTComponent</i>)
<i>Focusable</i>	whether the component can be focused. (Inherited from <i>AWTComponent</i>)
<i>Font</i>	The font of the component. (Inherited from <i>AWTComponent</i>)
<i>Foreground</i>	The foreground color of the component. (Inherited from <i>AWTComponent</i>)
<i>Height</i>	The current height of the component. (Inherited from <i>AWTComponent</i>)
<i>IsPassword</i>	whether the text field is a password text field.
<i>Name</i>	The name of the component. (Inherited from <i>AWTComponent</i>)
<i>NativeHandle</i>	The native window handle for the object. (Inherited from <i>INativeWindow</i>)
<i>SelectedText</i>	the current selected text. (Inherited from <i>AWTTextComponent</i>)
<i>SelectionEnd</i>	the end position of the selected text. (Inherited from <i>AWTTextComponent</i>)
<i>SelectionStart</i>	the start position of the selected text. (Inherited from <i>AWTTextComponent</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>Width</i>	The current width of the component. (Inherited from <i>AWTComponent</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant

Name	Description
	<i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
Clear	Removes all the text from the text component. (Inherited from AWTTextComponent)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)

Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject . (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)

Name	Description
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
SelectAll	Selects all the text in the text component. (Inherited from AWTTextComponent)
SetCaretPosition	Sets the position of the text insertion caret for this text component. (Inherited from AWTTextComponent)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
SetSelectionRange	Selects the text within the specified range. (Inherited from AWTTextComponent)
SetText	Sets the text of the text component to the specified text. (Inherited from AWTTextComponent)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)

Name	Description
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

AWTVerticalScrollbar Class

Description

Represents a vertical scroll bar.

Inheritance Hierarchy

- [AWTScrollbar](#)
 - AWTVerticalScrollbar

Syntax

```
'Declaration  
Public Class AWTVerticalScrollbar _  
Inherits AWTScrollbar
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
PageSize	the block increment value of the scroll bar. (Inherited from IAWTScroller)
Position	the current position of the scroll bar. (Inherited from IAWTScroller)
Range	the range value of the scroll bar. (Inherited from IAWTScroller)
StepSize	the unit increment value of the scroll bar. (Inherited from IAWTScroller)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)

Name	Description
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
Page	Increments the current scroll position by specified number of pages. (Inherited from IAWTScroller)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
ScrollTo	Scrolls to the specified position. (Inherited from IAWTScroller)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
Step	Increments the current scroll position by specified steps. (Inherited from IAWTScroller)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)

Name	Description
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

AWTWindow Class

Description

Represents a top-level window with no borders and no menubar.

Inheritance Hierarchy

- [AWTContainer](#)
 - AWTWindow
 - [AWTDialog](#)
 - [AWTFrame](#)
 - [JWindow](#)

Syntax

```
'Declaration  
Public Class AWTWindow _  
Inherits AWTContainer _  
Implements IMoveable
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)
WindowState	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from IMoveable)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
Close	Closes the window. (Inherited from IMoveable)
CloseSynchron	Closes the window and waits until the window is closed. (Inherited from IMoveable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetCloseWindows	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from IMoveable)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject . (Inherited from TestObject)
GetFocus	Returns the object with the input focus. (Inherited from IMoveable)
GetNextCloseWindow	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from IMoveable)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)

Name	Description
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsActive	Returns whether the window is set to active. (Inherited from IMoveable)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
Maximize	Maximizes the window. (Inherited from IMoveable)
Minimize	Reduces the window to an icon. (Inherited from IMoveable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the window. (Inherited from IMoveable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Restore	Restores the window to its previous size. (Inherited from IMoveable)

Name	Description
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
SetActive	Makes the window active. (Inherited from IMoveable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
Size	Resizes the window. (Inherited from IMoveable)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

BasicArrowButton Class

Description

Represents a push button with an arrow in one of the cardinal directions.

Inheritance Hierarchy

- [JButton](#)
 - BasicArrowButton

Syntax

```
'Declaration
Public Class BasicArrowButton _
Inherits JButton
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Direction	the direction the arrow points to.
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)

Name	Description
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
ToolTipText	the tool tip text of a Swing component. (Inherited from JComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)

Name	Description
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)

Name	Description
WaitForScreenshotStable	specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject) Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

IAWTScrollable Interface

Description

Represents an interface for AWT objects that can have two scroll bars.

Inheritance Hierarchy

- [IBaseScrollable](#)
 - IAWTScrollable

Syntax

```
'Declaration
Public Class IAWTScrollable _
Inherits IBaseScrollable
```

Properties

Name	Description
Position	the current scroll position of the scrollable component. (Inherited from IBaseScrollable)

Methods

Name	Description
GetHorizontalBar	Gets the horizontal scroll bar.
GetVerticalBar	Gets the vertical scroll bar.
ScrollTo	Scrolls to the specified position. (Inherited from IBaseScrollable)

IAWTScroller Interface

Description

Represents an interface for scrollable AWT objects.

Syntax

```
'Declaration
Public Class IAWTScroller
```

Properties

Name	Description
PageSize	the block increment value of the scroll bar.
Position	the current position of the scroll bar.
Range	the range value of the scroll bar.
StepSize	the unit increment value of the scroll bar.

Methods

Name	Description
Page	Increments the current scroll position by specified number of pages.
ScrollTo	Scrolls to the specified position.
Step	Increments the current scroll position by specified steps.

IBaseScrollable Interface

Description

Represents an interface for other scrollable controls to avoid duplication.

Syntax

```
'Declaration  
Public Class IBaseScrollable
```

Properties

Name	Description
Position	the current scroll position of the scrollable component.

Methods

Name	Description
ScrollTo	Scrolls to the specified position.

IOracleFormsMenuBase Interface

Description

Represents a control that defines choices for users to select.

Syntax

```
'Declaration  
Public Class IOracleFormsMenuBase
```

Properties

Name	Description
Checked	Whether the MenuItem is checked.

IOracleFormsScrollable Interface

Description

Represents an interface for scrollable oracle forms objects.

Syntax

```
'Declaration  
Public Class IOracleFormsScrollable
```

Properties

Name	Description
HorizontalScrollbarPageSize	the block increment value of the scroll bar.
HorizontalScrollbarPosition	the current position of the scroll bar.
HorizontalScrollbarRange	the range value of the scroll bar.
HorizontalScrollbarStepSize	the unit increment value of the scroll bar.
VerticalScrollbarPageSize	the block increment value of the scroll bar.
VerticalScrollbarPosition	the current position of the scroll bar.
VerticalScrollbarRange	the range value of the scroll bar.
VerticalScrollbarStepSize	the unit increment value of the scroll bar.

Methods

Name	Description
GetHorizontalScrollbar	Gets the horizontal scroll bar.
GetVerticalScrollbar	Gets the vertical scroll bar.
HorizontalScrollbarPage	Increments the current scroll position by specified number of pages.
HorizontalScrollbarScrollTo	Scrolls to the specified position.
HorizontalScrollbarScrollToMax	Scrolls to the maximum position of the scroller.
HorizontalScrollbarScrollToMin	Scrolls to the minimum position of the scroller.
HorizontalScrollbarStep	Increments the current scroll position by specified steps.
VerticalScrollbarPage	Increments the current scroll position by specified number of pages.
VerticalScrollbarScrollTo	Scrolls to the specified position.
VerticalScrollbarScrollToMax	Scrolls to the maximum position of the scroller.
VerticalScrollbarScrollToMin	Scrolls to the minimum position of the scroller.
VerticalScrollbarStep	Increments the current scroll position by specified steps.

IOracleFormsScroller Interface

Description

Represents an interface for scrollable oracle forms objects.

Inheritance Hierarchy

- [IAWTScroller](#)
 - IOracleFormsScroller

Syntax

```
'Declaration  
Public Class IOracleFormsScroller _  
Inherits IAWTScroller
```

Properties

Name	Description
PageSize	the block increment value of the scroll bar. (Inherited from IAWTScroller)
Position	the current position of the scroll bar. (Inherited from IAWTScroller)
Range	the range value of the scroll bar. (Inherited from IAWTScroller)
StepSize	the unit increment value of the scroll bar. (Inherited from IAWTScroller)

Methods

Name	Description
Page	Increments the current scroll position by specified number of pages. (Inherited from IAWTScroller)
ScrollTo	Scrolls to the specified position. (Inherited from IAWTScroller)
ScrollToMax	Scrolls to the maximum position of the scroller.
ScrollToMin	Scrolls to the minimum position of the scroller.
Step	Increments the current scroll position by specified steps. (Inherited from IAWTScroller)

JButton Class

Description

Represents a push button.

Inheritance Hierarchy

- [AbstractButton](#)
 - JButton

- [BasicArrowButton](#)

Syntax

```
'Declaration
Public Class JButton _
Inherits AbstractButton
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
ToolTipText	the tool tip text of a Swing component. (Inherited from JComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant

Name	Description
	<i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i>)
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i>)
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)

<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)

Name	Description
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
Select	Selects the button. (Inherited from AbstractButton)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout

Name	Description
<i>WaitForObject</i>	parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>) Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

JCheckBox Class

Description

Represents a check box.

Inheritance Hierarchy

- [*JToggleButton*](#)
 - `JCheckBox`

Syntax

```
'Declaration
Public Class JCheckBox _
Inherits JToggleButton
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Selected	whether the toggle button is selected. (Inherited from JToggleButton)
Text	The text of the control. (Inherited from TestObject)
ToolTipText	the tool tip text of a Swing component. (Inherited from JComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Check	Checks the check box.
Click	Clicks on the object. (Inherited from IClickable)

Name	Description
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)

Name	Description
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
Select	Selects the button. (Inherited from AbstractButton)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
Toggle	Toggles the button. (Inherited from JToggleButton)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
Uncheck	Unchecks the check box.
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout

Name	Description
WaitForObject	parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject) Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option OPT_WAIT_RESOLVE_OBJDEF. Use WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

JCheckBoxMenuItem Class

Description

Represents a check box control that can be included in a menu item.

Inheritance Hierarchy

- [JMenuItem](#)
 - JCheckBoxMenuItem

Syntax

```
'Declaration
Public Class JCheckBoxMenuItem _
Inherits JMenuItem
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Checked	whether the check box in a menu item is checked.
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
ToolTipText	the tool tip text of a Swing component. (Inherited from JComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by

Name	Description
	setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

JComponent Class

Description

Represents a class for all components except top-level containers.

Inheritance Hierarchy

- [AWTContainer](#)
 - JComponent
 - [AbstractButton](#)
 - [JColorChooser](#)
 - [JComboBox](#)
 - [JLabel](#)
 - [JLayeredPane](#)

- [JSplitPane](#)
- [JTabbedPane](#)
- [JTable](#)
- [JTableHeader](#)
- [JTextComponent](#)
- [JToolBar](#)
- [JTree](#)
- [JViewport](#)

Syntax

```
'Declaration
Public Class JComponent _
Inherits AWTContainer
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
ToolTipText	the tool tip text of a Swing component.
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)

Name	Description
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>OpenContextMenu</i>	Opens a context menu at the specified position. (Inherited from <i>AWTComponent</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ScrollIntoView</i>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <i>AWTComponent</i>)
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional

Name	Description
WaitForDisappearance	<p>timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)</p> <p>Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)</p>
WaitForObject	<p>Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code>. Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code>, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)</p>
WaitForProperty	<p>Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)</p>
WaitForPropertyNotEquals	<p>Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)</p>
WaitForScreenshotStable	<p>Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)</p>

JDesktopPane Class

Description

Represents a desktop pane.

Inheritance Hierarchy

- [JLayeredPane](#)
 - JDesktopPane

Syntax

```
'Declaration  
Public Class JDesktopPane _  
Inherits JLayeredPane
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
ToolTipText	the tool tip text of a Swing component. (Inherited from JComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)

Name	Description
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)

GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)

Name	Description
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>OpenContextMenu</i>	Opens a context menu at the specified position. (Inherited from <i>AWTComponent</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ScrollIntoView</i>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <i>AWTComponent</i>)
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

Name	Description
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

JDIALOG Class

Description

Represents a dialog box.

Inheritance Hierarchy

- [AWTDialog](#)
 - JDIALOG

Syntax

```
'Declaration
Public Class JDIALOG _
Inherits AWTDialog
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Modal	whether the dialog is modal. (Inherited from AWTDialog)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Resizable	whether the dialog is resizable by the user. (Inherited from AWTDialog)
Text	The text of the control. (Inherited from TestObject)
Title	the title of the dialog. (Inherited from AWTDialog)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)
WindowState	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from IMoveable)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant

Name	Description
	<i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
Close	Closes the window. (Inherited from IMoveable)
CloseSynchron	Closes the window and waits until the window is closed. (Inherited from IMoveable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetCloseWindows	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from IMoveable)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject . (Inherited from TestObject)
GetFocus	Returns the object with the input focus. (Inherited from IMoveable)
GetNextCloseWindow	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from IMoveable)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)

Name	Description
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsActive	Returns whether the window is set to active. (Inherited from IMoveable)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
Maximize	Maximizes the window. (Inherited from IMoveable)
Minimize	Reduces the window to an icon. (Inherited from IMoveable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the window. (Inherited from IMoveable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Restore	Restores the window to its previous size. (Inherited from IMoveable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
SetActive	Makes the window active. (Inherited from IMoveable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)

Name	Description
Size	Resizes the window. (Inherited from IMoveable)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout

Name	Description
	parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

JEditorPane Class

Description

Represents a text component where you can edit different types of content.

Inheritance Hierarchy

- [JTextComponent](#)
 - JEditorPane
 - [JTextPane](#)

Syntax

```
'Declaration
Public Class JEditorPane _
Inherits JTextComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
CaretPosition	the position of the text insertion caret for the text component. (Inherited from JTextComponent)
ContentType	the type of content that this editor is currently set to deal with.
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Editable	whether the text of the text component can be changed by the user. (Inherited from JTextComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
FormattedText	the text of the editor pane.

Name	Description
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Page	the current URL being displayed.
SelectedText	the current selected text. (Inherited from JTextComponent)
SelectionEnd	the end position of the selection. (Inherited from JTextComponent)
SelectionStart	the start position of the selection. (Inherited from JTextComponent)
Text	The text of the control. (Inherited from TestObject)
ToolTipText	the tool tip text of a Swing component. (Inherited from JComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
Clear	Removes all the text from text component. (Inherited from JTextComponent)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)

Name	Description
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
SelectAll	Selects all the content in the text component. (Inherited from JTextComponent)
SetCaretPosition	Sets the position of the text insertion caret for this text component. (Inherited from JTextComponent)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
SetSelectionRange	Selects the text within the specified range. (Inherited from JTextComponent)
SetText	Sets the text content to the specified text. (Inherited from JTextComponent)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by

Name	Description
	setting the value of the option <i>OPT_WAIT_RESOLVE_OBJDEF</i> . Use <i>WaitForObject</i> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <i>WaitForObject</i> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <i>WaitForObject</i> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <i>OPT_WAIT_RESOLVE_OBJDEF</i> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <i>OPT_WAIT_RESOLVE_OBJDEF</i> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <i>OPT_WAIT_RESOLVE_OBJDEF</i> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

JFrame Class

Description

Represents a class for an extended version of *AWTFrame* that adds support for Java Swing.

Inheritance Hierarchy

- *AWTFrame*
 - *JFrame*

Syntax

```
'Declaration
Public Class JFrame _
Inherits AWTFrame
```

Properties

Name	Description
<i>AccessibleName</i>	The accessible name of the component. (Inherited from <i>AWTComponent</i>)
<i>AccessibleRole</i>	The accessible role of the component. (Inherited from <i>AWTComponent</i>)

Name	Description
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Resizable	whether the frame is resizable by the user. (Inherited from AWTFrame)
Text	The text of the control. (Inherited from TestObject)
Title	the title of the frame. (Inherited from AWTFrame)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)
WindowState	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from IMoveable)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
Close	Closes the window. (Inherited from IMoveable)
CloseSynchron	Closes the window and waits until the window is closed. (Inherited from IMoveable)

Name	Description
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetCloseWindows	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from IMoveable)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetFocus	Returns the object with the input focus. (Inherited from IMoveable)
GetNextCloseWindow	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from IMoveable)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)

Name	Description
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsActive	Returns whether the window is set to active. (Inherited from IMoveable)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
Maximize	Maximizes the window. (Inherited from IMoveable)
Minimize	Reduces the window to an icon. (Inherited from IMoveable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the window. (Inherited from IMoveable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Restore	Restores the window to its previous size. (Inherited from IMoveable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
SetActive	Makes the window active. (Inherited from IMoveable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
Size	Resizes the window. (Inherited from IMoveable)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)

Name	Description
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

JHorizontalScrollBar Class

Description

Represents a horizontal scroll bar.

Inheritance Hierarchy

- [JScrollBar](#)
 - JHorizontalScrollBar

Syntax

```
'Declaration  
Public Class JHorizontalScrollBar _  
Inherits JScrollBar
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
PageSize	the block increment value of the scroll bar. (Inherited from IAWTScroller)
Position	the current position of the scroll bar. (Inherited from IAWTScroller)
Range	the range value of the scroll bar. (Inherited from IAWTScroller)
StepSize	the unit increment value of the scroll bar. (Inherited from IAWTScroller)

Name	Description
Text	The text of the control. (Inherited from TestObject)
ToolTipText	the tool tip text of a Swing component. (Inherited from JComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant System.Drawing.Imaging.PixelFormat.Format32bppRgb can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)

Name	Description
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
Page	Increments the current scroll position by specified number of pages. (Inherited from IAWTScroller)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
ScrollTo	Scrolls to the specified position. (Inherited from IAWTScroller)
SetFocus	Gives focus to the control. (Inherited from IFocusable)

Name	Description
 SetProperty 	Sets the value of the specified property. (Inherited from TestObject)
 Step 	Increments the current scroll position by specified steps. (Inherited from IAWTScroller)
 TextCapture 	Returns the text in this object's visible area. (Inherited from TestObject)
 TextClick 	Clicks in the center of the specified text. (Inherited from TestObject)
 TextExists 	Returns whether the specified text exists. (Inherited from TestObject)
 TextRectangle 	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
 TypeKeys 	Sends a set of keystrokes to the object. (Inherited from IKeyable)
 TypePasswordKeys 	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
 WaitForChildDisappearance 	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForDisappearance 	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForObject 	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
 WaitForProperty 	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForPropertyNotEquals 	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

JLabel Class

Description

Represents a display area for displaying a short text, image, or both.

Inheritance Hierarchy

- [JComponent](#)
 - JLabel

Syntax

```
'Declaration
Public Class JLabel _
Inherits JComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Alignment	the alignment of the label.
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)

Name	Description
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
ToolTipText	the tool tip text of a Swing component. (Inherited from JComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

(Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

JLayeredPane Class

Description

Represents a layered pane.

Inheritance Hierarchy

- [JComponent](#)
 - JLayeredPane
 - [JDesktopPane](#)

Syntax

```
'Declaration
Public Class JLayeredPane _
Inherits JComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
ToolTipText	the tool tip text of a Swing component. (Inherited from JComponent)

Name	Description
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)

Name	Description
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

JList Class

Description

Represents a list box.

Inheritance Hierarchy

- [JComponent](#)
 - JList

Syntax

```
'Declaration  
Public Class JList _  
Inherits JComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
ItemCount	the number of list items.
Items	the list of all contained list items.
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
SelectedIndex	the index of the selected list item.
SelectedIndices	the list of indices of the selected list items.
SelectedItem	the name or index of the selected list item.
SelectedItems	the list of names or indices of the selected list items.

Name	Description
Text	The text of the control. (Inherited from TestObject)
ToolTipText	the tool tip text of a Swing component. (Inherited from JComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant System.Drawing.Imaging.PixelFormat.Format32bppRgb can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
ClickItem	Clicks the specified list item.
Deselect	Deselects the specified list item.
DeselectAll	Deselects all list items.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DoubleClickItem	Double-clicks a list item.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
FindItem	Returns the index of an item in the list.
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from TestObject)
GetItem	Returns the item at the specified index.
GetItemRect	Returns the size and position of the item relative to the list.
GetItemValue	Returns the value object of the list item.
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)

Name	Description
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
ScrollItemIntoView	Scrolls an item into view.
Select	Selects a list item.
SelectAll	Selects all list elements.
SelectRange	Selects a specified range of list elements.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)

Name	Description
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

JMenu Class

Description

Represents a menu. A menu is a menu item that has child items.

Inheritance Hierarchy

- [JMenuItem](#)
 - JMenu

Syntax

```
'Declaration
Public Class JMenu _
Inherits JMenuItem
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)

Name	Description
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
ToolTipText	the tool tip text of a Swing component. (Inherited from JComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForDisappearance 	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForObject 	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
 WaitForProperty 	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForPropertyNotEquals 	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForScreenshotStable 	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If

Name	Description
	you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

JMenuItem Class

Description

Represents a menu item.

Inheritance Hierarchy

```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)

Name	Description
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
ToolTipText	the tool tip text of a Swing component. (Inherited from JComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)

Name	Description
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
Select	Selects the button. (Inherited from AbstractButton)
SetFocus	Gives focus to the control. (Inherited from IFocusable)

Name	Description
 SetProperty 	Sets the value of the specified property. (Inherited from TestObject)
 TextCapture 	Returns the text in this object's visible area. (Inherited from TestObject)
 TextClick 	Clicks in the center of the specified text. (Inherited from TestObject)
 TextExists 	Returns whether the specified text exists. (Inherited from TestObject)
 TextRectangle 	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
 TypeKeys 	Sends a set of keystrokes to the object. (Inherited from IKeyable)
 TypePasswordKeys 	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
 WaitForChildDisappearance 	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForDisappearance 	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
 WaitForObject 	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. JPasswordField Class

Description

Represents a single-line field that does not show the original characters.

Inheritance Hierarchy

- [JTextField](#)
 - JPasswordField

Syntax

```
'Declaration  
Public Class JPasswordField _  
Inherits JTextField
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Alignment	the alignment of the text field. (Inherited from JTextField)
Background	The background color of the component. (Inherited from AWTComponent)
CaretPosition	the position of the text insertion caret for the text component. (Inherited from JTextComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
EchoChar	the character that is displayed instead of the characters that are actually typed.
EchoCharSet	whether EchoChar is set to a value other than 0.
Editable	whether the text of the text component can be changed by the user. (Inherited from JTextComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)

Name	Description
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
SelectedText	the current selected text. (Inherited from JTextComponent)
SelectionEnd	the end position of the selection. (Inherited from JTextComponent)
SelectionStart	the start position of the selection. (Inherited from JTextComponent)
Text	The text of the control. (Inherited from TestObject)
ToolTipText	the tool tip text of a Swing component. (Inherited from JComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description

<i>OpenContextMenu</i>	Opens a context menu at the specified position. (Inherited from <i>AWTComponent</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)

Name	Description
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly

Name	Description
	pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

JProgressBar Class

Description

Displays the progress of an operation.

Inheritance Hierarchy

- [JComponent](#)
 - JProgressBar

Syntax

```
'Declaration
Public Class JProgressBar _
Inherits JComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)

Name	Description
Indeterminate	whether the progress bar is indeterminate.
Maximum	the progress bar's maximum value.
Minimum	the progress bar's minimum value.
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
ProgressString	the string representation of the current progress.
Text	The text of the control. (Inherited from TestObject)
ToolTipText	the tool tip text of a Swing component. (Inherited from JComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)

Name	Description
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)

Name	Description
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

JScrollBar Class

Description

Represents a scroll bar.

Inheritance Hierarchy

- [JComponent](#)
 - JScrollBar
 - [JHorizontalScrollBar](#)
 - [JVerticalScrollBar](#)

Syntax

```
'Declaration  
Public Class JScrollBar _  
Inherits JComponent _  
Implements IAWTScroller
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
PageSize	the block increment value of the scroll bar. (Inherited from IAWTScroller)
Position	the current position of the scroll bar. (Inherited from IAWTScroller)

Name	Description
Range	the range value of the scroll bar. (Inherited from IAWTScroller)
StepSize	the unit increment value of the scroll bar. (Inherited from IAWTScroller)
Text	The text of the control. (Inherited from TestObject)
ToolTipText	the tool tip text of a Swing component. (Inherited from JComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)

Name	Description
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject . (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
Page	Increments the current scroll position by specified number of pages. (Inherited from IAWTScroller)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
ScrollTo	Scrolls to the specified position. (Inherited from IAWTScroller)

Name	Description
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
Step	Increments the current scroll position by specified steps. (Inherited from IAWTScroller)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used.

Name	Description
	An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

JScrollPane Class

Description

Represents a scroll pane which allows scrolling its content which may be larger than the pane itself.

Inheritance Hierarchy

- [JComponent](#)
 - JScrollPane

Syntax

```
'Declaration
Public Class JScrollPane _
Inherits JComponent _
Implements IBaseScrollable
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)

Name	Description
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Position	the current scroll position of the scrollable component. (Inherited from IBaseScrollable)
Text	The text of the control. (Inherited from TestObject)
ToolTipText	the tool tip text of a Swing component. (Inherited from JComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)

GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)

Name	Description
GetHorizontalBar	Gets the horizontal scroll bar.
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetVerticalBar	Gets the vertical scroll bar.
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)

Name	Description
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
ScrollTo	Scrolls to the specified position. (Inherited from IBaseScrollable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)

JSlider Class

Description

Represents a slider control which can select a value within a range.

Inheritance Hierarchy

- [JComponent](#)
 - JSlider

Syntax

```
'Declaration
Public Class JSlider _
Inherits JComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)

Name	Description
Inverted	the value is <i>true</i> if the value-range shown for the slider is reversed.
Maximum	the maximum value supported by the slider.
Minimum	the minimum value supported by the slider.
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Position	the position of the slider.
Text	The text of the control. (Inherited from TestObject)
ToolTipText	the tool tip text of a Swing component. (Inherited from JComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)

Name	Description
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
ToolTipText	the tool tip text of a Swing component. (Inherited from JComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)

Name	Description
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject . (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Next	Sets the spinner to the object in the sequence that comes after the object returned by the Value property.
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Previous	Sets the spinner to the object in the sequence that comes before the object returned by the Value property.
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)

Name	Description
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

JSplitPane Class

Description

Represents a split pane control which divides two components horizontally or vertically.

Inheritance Hierarchy

- [JComponent](#)
 - JSplitPane

Syntax

```
'Declaration
Public Class JSplitPane _
Inherits JComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
DividerLocation	the current divider location.
DividerSize	the size of the divider.
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
MaximumDividerLocation	the maximum location of the divider.

Name	Description
MinimumDividerLocation	the minimum location of the divider.
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
ToolTipText	the tool tip text of a Swing component. (Inherited from JComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)

Name	Description
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>OpenContextMenu</i>	Opens a context menu at the specified position. (Inherited from <i>AWTComponent</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ScrollIntoView</i>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <i>AWTComponent</i>)
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)

Name	Description
SetPosition	Sets the position of the divider.
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

JTabbedPane Class

Description

Represents a tabbed pane.

Inheritance Hierarchy

- [JComponent](#)
 - JTabbedPane

Syntax

```
'Declaration
Public Class JTabbedPane _
Inherits JComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)

Name	Description
SelectedTab	the currently selected tab.
SelectedTabIndex	the index of the currently selected tab or -1 (4Test: 0) if no tab is selected.
TabCount	the number of tabs.
TabRunCount	the number of tab runs currently used to display the tabs.
Text	The text of the control. (Inherited from TestObject)
ToolTipText	the tool tip text of a Swing component. (Inherited from JComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)

Name	Description
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetTabIndex	Returns the tab index.
GetTabTitle	Returns the tab title.
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
IsTabEnabled	Returns whether or not the tab is currently enabled.
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)

Name	Description
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
Select	Selects the specified tab.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout

Name	Description
	specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

JTable Class

Description

Represents a table control which has rows and columns.

Inheritance Hierarchy

- [JComponent](#)
 - JTable

Syntax

```
'Declaration
Public Class JTable _
Inherits JComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
AllCellTexts	the text values of all cells in the table. The cells are grouped in rows, where each row contains the texts of its cells.
AllCellValues	the values of all cells in the table. The cells are grouped in rows, where each row contains the values of its cells.
Background	The background color of the component. (Inherited from AWTComponent)
ColumnCount	the number of columns in the table.
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
EditingColumn	the name or index of the column that contains the cell currently being edited.
EditingRow	the index of the row that contains the cell currently being edited.
Enabled	whether the component is enabled. (Inherited from AWTComponent)

Name	Description
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
RowCount	the number of rows that can be shown in the table.
SelectedColumn	the index or name of the selected column. -1 (4Test: 0) is returned if no column is selected.
SelectedColumns	the list of indices of all selected columns.
SelectedRow	the index of the selected row, -1 (4Test: 0) is returned if no row is selected.
SelectedRows	the list of indices of all selected rows.
Text	The text of the control. (Inherited from TestObject)
ToolTipText	the tool tip text of a Swing component. (Inherited from JComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ClearSelection	Deselects all selected columns and rows.
Click	Clicks on the object. (Inherited from IClickable)
ClickCell	Clicks the specified cell in the table.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DoubleClickCell	Double-clicks the specified cell in the table.

Name	Description
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindCell</i>	Returns the cell containing the specified text.
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetCellText</i>	Returns the cell text.
<i>GetCellValue</i>	Returns the cell value.
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetColumnName</i>	Returns the name of the column at the specified index.
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)

Name	Description
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsCellEditable	Returns true if the specified cell is editable.
IsCellSelected	Returns true if the specified cell is selected; otherwise false.
IsColumnSelected	Returns true if the specified column is selected.
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
IsRowSelected	Returns true if the specified row is selected.
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MoveColumn	Moves the column to the position of the target column.
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ResizeColumn	Resizes the specified column.
ScrollCellIntoView	Scrolls the specified cell into view.
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
SelectAll	Selects all rows, columns, and cells in the table.
SelectColumn	Selects the specified column.
SelectRow	Selects the specified row.
SetCellValue	Sets the specified value for the specified cell in the table.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)

Name	Description
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

JTableHeader Class

Description

Represents table header class for the table component.

Inheritance Hierarchy

- [JComponent](#)
 - JTableHeader

Syntax

```
'Declaration  
Public Class JTableHeader _  
Inherits JComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
ToolTipText	the tool tip text of a Swing component. (Inherited from JComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
ClickColumnHeader	Clicks the column header of the table.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject . (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)

Name	Description
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)

Name	Description
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

JTextArea Class

Description

Represents a multiple-line area control that displays plain text.

Inheritance Hierarchy

- [JTextComponent](#)
 - `JTextArea`

Syntax

```
'Declaration  
Public Class JTextArea _  
Inherits JTextComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
CaretPosition	the position of the text insertion caret for the text component. (Inherited from JTextComponent)
Columns	the number of columns in the text area.
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Editable	whether the text of the text component can be changed by the user. (Inherited from JTextComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Rows	The number of rows in the text area.
SelectedText	the current selected text. (Inherited from JTextComponent)
SelectionEnd	the end position of the selection. (Inherited from JTextComponent)
SelectionStart	the start position of the selection. (Inherited from JTextComponent)
Text	The text of the control. (Inherited from TestObject)
ToolTipText	the tool tip text of a Swing component. (Inherited from JComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Clear	Removes all the text from text component. (Inherited from JTextComponent)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)

Name	Description
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Insert</i>	Inserts the specified text at the specified position.
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>OpenContextMenu</i>	Opens a context menu at the specified position. (Inherited from <i>AWTComponent</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReplaceRange</i>	Replaces text within the specified range with the new text specified.
<i>ScrollIntoView</i>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <i>AWTComponent</i>)
<i>SelectAll</i>	Selects all the content in the text component. (Inherited from <i>JTextComponent</i>)
<i>SetCaretPosition</i>	Sets the position of the text insertion caret for this text component. (Inherited from <i>JTextComponent</i>)
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>SetSelectionRange</i>	Selects the text within the specified range. (Inherited from <i>JTextComponent</i>)
<i>SetText</i>	Sets the text content to the specified text. (Inherited from <i>JTextComponent</i>)

Name	Description
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
GetParent	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
GetProperty	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
HighlightObject	Highlights this object. (Inherited from <i>TestObject</i>)
ImageClick	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
ImageClickFile	Clicks on the specified image. (Inherited from <i>TestObject</i>)
ImageExists	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
ImageExistsFile	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
Invoke	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
InvokeMethods	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
IsFocused	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from <i>AWTComponent</i>)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)

Name	Description
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
SelectAll	Selects all the content in the text component.
SetCaretPosition	Sets the position of the text insertion caret for this text component.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
SetSelectionRange	Selects the text within the specified range.
SetText	Sets the text content to the specified text.
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
WaitForPropertyNotEquals	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

JTextField Class

Description

Represents a single-line text field control whose text can be modified by the user.

Inheritance Hierarchy

- [JTextComponent](#)

<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)

Name	Description
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
SelectAll	Selects all the content in the text component. (Inherited from JTextComponent)
SetCaretPosition	Sets the position of the text insertion caret for this text component. (Inherited from JTextComponent)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
SetSelectionRange	Selects the text within the specified range. (Inherited from JTextComponent)
SetText	Sets the text content to the specified text. (Inherited from JTextComponent)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

JTextPane Class

Description

Represents a text pane control that can be marked with attributes that are represented graphically.

Inheritance Hierarchy

- [JEditorPane](#)
 - JTextPane

Syntax

```
'Declaration
Public Class JTextPane _
Inherits JEditorPane
```

Properties

Name	Description
<i>AccessibleName</i>	The accessible name of the component. (Inherited from <i>AWTComponent</i>)
<i>AccessibleRole</i>	The accessible role of the component. (Inherited from <i>AWTComponent</i>)
<i>Background</i>	The background color of the component. (Inherited from <i>AWTComponent</i>)
<i>CaretPosition</i>	the position of the text insertion caret for the text component. (Inherited from <i>JTextComponent</i>)
<i>CharacterAttributes</i>	the character attributes in effect at the location of the caret.
<i>ContentType</i>	the type of content that this editor is currently set to deal with. (Inherited from <i>JEditorPane</i>)
<i>Cursor</i>	The name of the cursor set in the component. (Inherited from <i>AWTComponent</i>)
<i>Editable</i>	whether the text of the text component can be changed by the user. (Inherited from <i>JTextComponent</i>)
<i>Enabled</i>	whether the component is enabled. (Inherited from <i>AWTComponent</i>)
<i>Focusable</i>	whether the component can be focused. (Inherited from <i>AWTComponent</i>)
<i>Font</i>	The font of the component. (Inherited from <i>AWTComponent</i>)
<i>Foreground</i>	The foreground color of the component. (Inherited from <i>AWTComponent</i>)
<i>FormattedText</i>	the text of the editor pane. (Inherited from <i>JEditorPane</i>)
<i>Height</i>	The current height of the component. (Inherited from <i>AWTComponent</i>)
<i>LogicalStyle</i>	the logical style assigned to the current paragraph in effect at the location of the caret.
<i>Name</i>	The name of the component. (Inherited from <i>AWTComponent</i>)
<i>NativeHandle</i>	The native window handle for the object. (Inherited from <i>INativeWindow</i>)
<i>Page</i>	the current URL being displayed. (Inherited from <i>JEditorPane</i>)
<i>ParagraphAttributes</i>	the attributes of the current paragraph in effect at the location of the caret.
<i>SelectedText</i>	the current selected text. (Inherited from <i>JTextComponent</i>)
<i>SelectionEnd</i>	the end position of the selection. (Inherited from <i>JTextComponent</i>)
<i>SelectionStart</i>	the start position of the selection. (Inherited from <i>JTextComponent</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>ToolTipText</i>	the tool tip text of a Swing component. (Inherited from <i>JComponent</i>)

Name	Description
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Clear	Removes all the text from text component. (Inherited from JTextComponent)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
SelectAll	Selects all the content in the text component. (Inherited from JTextComponent)
SetCaretPosition	Sets the position of the text insertion caret for this text component. (Inherited from JTextComponent)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)

Name	Description
SetSelectionRange	Selects the text within the specified range. (Inherited from JTextComponent)
SetText	Sets the text content to the specified text. (Inherited from JTextComponent)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

JToggleButton Class

Description

Represents a two-state button.

Inheritance Hierarchy

- [AbstractButton](#)
 - JToggleButton
 - [JCheckBox](#)
 - [JRadioButton](#)

Syntax

```
'Declaration
Public Class JToggleButton _
Inherits AbstractButton
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)

Name	Description
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Selected	whether the toggle button is selected.
Text	The text of the control. (Inherited from TestObject)
ToolTipText	the tool tip text of a Swing component. (Inherited from JComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)

Name	Description
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)

Name	Description
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

JTree Class

Description

Represents a tree.

Inheritance Hierarchy

- [JComponent](#)
 - JTree

Syntax

```
'Declaration  
Public Class JTree _  
Inherits JComponent
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
IsEditable	whether the tree is editable.
IsEditing	whether the tree is being edited.
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
SelectedItemPath	the selected item path.
SelectedItemPaths	the list of selected item paths.
SelectedItemText	the selected item text.
SelectionCount	the number of tree nodes selected.

Name	Description
Text	The text of the control. (Inherited from TestObject)
ToolTipText	the tool tip text of a Swing component. (Inherited from JComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
VisibleItemPaths	the visible items in the tree as item paths.
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CancelEditing	Cancels the current editing session.
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ClearSelection	Clears the selection.
Click	Clicks on the object. (Inherited from IClickable)
ClickNode	Clicks on a tree node specified by the item path.
Collapse	Collapses the tree node identified by the specified item path.
CollapseAll	Collapses all tree nodes.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DoubleClickNode	Double-clicks on a tree node specified by the item path.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Expand	Expands the tree node identified by the specified item path.
ExpandAll	Expands all tree nodes.
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)

Name	Description
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetItemRect	Returns the size and position of the item relative to the tree.
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsExpanded	Returns 'true' if the specified item path is expanded.
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
IsPathEditable	whether an item path is editable.
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
ScrollPathIntoView	Scrolls the given item path to a visible position.
Select	Selects a tree node identified by the specified item path.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
StartEditing	Starts editing at given item path or current selection.
StopEditing	Stops the current editing session.
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a

Name	Description
	WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

JVerticalScrollBar Class

Description

Represents a vertical scroll bar.

Inheritance Hierarchy

- [JScrollBar](#)
 - JVerticalScrollBar

Syntax

```
'Declaration
Public Class JVerticalScrollBar _
Inherits JScrollBar
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)

Name	Description
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
PageSize	the block increment value of the scroll bar. (Inherited from IAWTScroller)
Position	the current position of the scroll bar. (Inherited from IAWTScroller)
Range	the range value of the scroll bar. (Inherited from IAWTScroller)
StepSize	the unit increment value of the scroll bar. (Inherited from IAWTScroller)
Text	The text of the control. (Inherited from TestObject)
ToolTipText	the tool tip text of a Swing component. (Inherited from JComponent)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. <i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)

Name	Description
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
Page	Increments the current scroll position by specified number of pages. (Inherited from IAWTScroller)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
ScrollTo	Scrolls to the specified position. (Inherited from IAWTScroller)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
Step	Increments the current scroll position by specified steps. (Inherited from IAWTScroller)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
WaitForObject	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject) Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

JWindow Class

Description

Represents a container that can be displayed anywhere on the user's desktop.

Inheritance Hierarchy

- [AWTWindow](#)
 - JWindow

Syntax

```
'Declaration
Public Class JWindow _
Inherits AWTWindow
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)

Name	Description
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)
WindowState	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from IMoveable)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
Close	Closes the window. (Inherited from IMoveable)
CloseSynchron	Closes the window and waits until the window is closed. (Inherited from IMoveable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the

Name	Description
	agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetCloseWindows	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from IMoveable)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetFocus	Returns the object with the input focus. (Inherited from IMoveable)
GetNextCloseWindow	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from IMoveable)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)

Name	Description
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsActive	Returns whether the window is set to active. (Inherited from IMoveable)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
Maximize	Maximizes the window. (Inherited from IMoveable)
Minimize	Reduces the window to an icon. (Inherited from IMoveable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the window. (Inherited from IMoveable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Restore	Restores the window to its previous size. (Inherited from IMoveable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
SetActive	Makes the window active. (Inherited from IMoveable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
Size	Resizes the window. (Inherited from IMoveable)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)

Name	Description
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

OracleFormsApplication Class

Description

Represents an Oracle Forms application.

Inheritance Hierarchy

- [OracleFormsContainer](#)
 - OracleFormsApplication

Syntax

```
'Declaration
Public Class OracleFormsApplication _
Inherits OracleFormsContainer
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
SplashScreenRunning	whether the application currently displays a splash screen.
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored

Name	Description
	in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this <code>TestObject</code> . (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)

Name	Description
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>OpenContextMenu</i>	Opens a context menu at the specified position. (Inherited from <i>AWTComponent</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ScrollIntoView</i>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <i>AWTComponent</i>)
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

Name	Description
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . ```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)

Name	Description
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
ItemCount	the number of items in the choice.
Items	the list of choice items.
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
SelectedIndex	the index of the selected item. -1 (4Test: 0) is returned, if no item is currently selected.
SelectedItem	the selected item.
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the

Name	Description
	agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>GetItemText</i>	Returns the item at the specified index.
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)

Name	Description
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
Select	Selects the specified item in the choice.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by

Name	Description
	setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

OracleFormsComboBox Class

Description

Represents a combo box.

Inheritance Hierarchy

- [OracleFormsChoice](#)
 - OracleFormsComboBox

Syntax

```
'Declaration
Public Class OracleFormsComboBox _
Inherits OracleFormsChoice
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)

Name	Description
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
DropDownOpen	whether the drop down is currently open.
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
ItemCount	the number of items in the choice. (Inherited from OracleFormsChoice)
Items	the list of choice items. (Inherited from OracleFormsChoice)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
SelectedIndex	the index of the selected item. -1 (4Test: 0) is returned, if no item is currently selected. (Inherited from OracleFormsChoice)
SelectedItem	the selected item. (Inherited from OracleFormsChoice)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)

Name	Description
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetItemText	Returns the item at the specified index. (Inherited from OracleFormsChoice)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)

Name	Description
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
Select	Selects the specified item in the choice. (Inherited from OracleFormsChoice)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
SetText	Sets the text of the combo box to the specified text.
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

OracleFormsHorizontalScrollbar Class

Description

Represents a horizontal scroll bar.

Inheritance Hierarchy

- [OracleFormsScrollbar](#)
 - OracleFormsHorizontalScrollbar

Syntax

```
'Declaration  
Public Class OracleFormsHorizontalScrollbar _  
Inherits OracleFormsScrollbar
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
PageSize	the block increment value of the scroll bar. (Inherited from IOracleFormsScroller)
Position	the current position of the scroll bar. (Inherited from IOracleFormsScroller)
Range	the range value of the scroll bar. (Inherited from IOracleFormsScroller)

Name	Description
<i>StepSize</i>	the unit increment value of the scroll bar. (Inherited from <i>IOracleFormsScroller</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>Width</i>	The current width of the component. (Inherited from <i>AWTComponent</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. <i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)

Name	Description
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
Page	Increments the current scroll position by specified number of pages. (Inherited from IOracleFormsScroller)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
ScrollTo	Scrolls to the specified position. (Inherited from IOracleFormsScroller)
ScrollToMax	Scrolls to the maximum position of the scroller. (Inherited from IOracleFormsScroller)

Name	Description
ScrollToMin	Scrolls to the minimum position of the scroller. (Inherited from IOracleFormsScroller)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
Step	Increments the current scroll position by specified steps. (Inherited from IOracleFormsScroller)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly

Name	Description
	pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

OracleFormsLabel Class

Description

Represents a class for placing text in a container.

Inheritance Hierarchy

- [OracleFormsContainer](#)
 - OracleFormsLabel

Syntax

```
'Declaration
Public Class OracleFormsLabel _
Inherits OracleFormsContainer
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)

Name	Description
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)

Name	Description
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject . (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)

Name	Description
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

OracleFormsListBox Class

Description

Represents a ListBox.

Inheritance Hierarchy

- [OracleFormsChoice](#)
 - OracleFormsListBox

Syntax

```
'Declaration
Public Class OracleFormsListBox _
Inherits OracleFormsChoice _
Implements IOracleFormsScrollable
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
HorizontalScrollbarPageSize	the block increment value of the scroll bar. (Inherited from IOracleFormsScrollable)
HorizontalScrollbarPosition	the current position of the scroll bar. (Inherited from IOracleFormsScrollable)
HorizontalScrollbarRange	the range value of the scroll bar. (Inherited from IOracleFormsScrollable)

Name	Description
HorizontalScrollbarStepSize	the unit increment value of the scroll bar. (Inherited from IOracleFormsScrollable)
ItemCount	the number of items in the choice. (Inherited from OracleFormsChoice)
Items	the list of choice items. (Inherited from OracleFormsChoice)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
SelectedIndex	the index of the selected item. -1 (4Test: 0) is returned, if no item is currently selected. (Inherited from OracleFormsChoice)
SelectedItem	the selected item. (Inherited from OracleFormsChoice)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
VerticalScrollbarPageSize	the block increment value of the scroll bar. (Inherited from IOracleFormsScrollable)
VerticalScrollbarPosition	the current position of the scroll bar. (Inherited from IOracleFormsScrollable)
VerticalScrollbarRange	the range value of the scroll bar. (Inherited from IOracleFormsScrollable)
VerticalScrollbarStepSize	the unit increment value of the scroll bar. (Inherited from IOracleFormsScrollable)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
ClickItem	Clicks the specified list item.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DoubleClickItem	Double-clicks a list item.

Name	Description
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetHorizontalScrollbar	Gets the horizontal scroll bar. (Inherited from IOracleFormsScrollable)
GetItemText	Returns the item at the specified index. (Inherited from OracleFormsChoice)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetVerticalScrollbar	Gets the vertical scroll bar. (Inherited from IOracleFormsScrollable)
HighlightObject	Highlights this object. (Inherited from TestObject)
HorizontalScrollbarPage	Increments the current scroll position by specified number of pages. (Inherited from IOracleFormsScrollable)
HorizontalScrollbarScrollTo	Scrolls to the specified position. (Inherited from IOracleFormsScrollable)
HorizontalScrollbarScrollToMax	Scrolls to the maximum position of the scroller. (Inherited from IOracleFormsScrollable)
HorizontalScrollbarScrollToMin	Scrolls to the minimum position of the scroller. (Inherited from IOracleFormsScrollable)
HorizontalScrollbarStep	Increments the current scroll position by specified steps. (Inherited from IOracleFormsScrollable)

Name	Description
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
Select	Selects the specified item in the choice. (Inherited from OracleFormsChoice)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)

Name	Description
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
VerticalScrollbarPage	Increments the current scroll position by specified number of pages. (Inherited from IOracleFormsScrollable)
VerticalScrollbarScrollTo	Scrolls to the specified position. (Inherited from IOracleFormsScrollable)
VerticalScrollbarScrollToMax	Scrolls to the maximum position of the scroller. (Inherited from IOracleFormsScrollable)
VerticalScrollbarScrollToMin	Scrolls to the minimum position of the scroller. (Inherited from IOracleFormsScrollable)
VerticalScrollbarStep	Increments the current scroll position by specified steps. (Inherited from IOracleFormsScrollable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

OracleFormsListView Class

Description

Represents a listview.

Inheritance Hierarchy

- [OracleFormsContainer](#)
 - OracleFormsListView

Syntax

```
'Declaration
Public Class OracleFormsListView _
Inherits OracleFormsContainer _
Implements IOracleFormsScrollable
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
AllCellTexts	the text values of all cells in the listview. The cells are grouped in rows, where each row contains the texts of its cells.
Background	The background color of the component. (Inherited from AWTComponent)
ColumnCount	the number of columns in the listview.
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
FocusedRow	the index of the focused row, -1 (4Test: 0) is returned if no row is focused.
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)

Name	Description
Height	The current height of the component. (Inherited from AWTComponent)
HorizontalScrollbarPageSize	the block increment value of the scroll bar. (Inherited from IOracleFormsScrollable)
HorizontalScrollbarPosition	the current position of the scroll bar. (Inherited from IOracleFormsScrollable)
HorizontalScrollbarRange	the range value of the scroll bar. (Inherited from IOracleFormsScrollable)
HorizontalScrollbarStepSize	the unit increment value of the scroll bar. (Inherited from IOracleFormsScrollable)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
RowCount	the number of rows in the listview.
SelectedRow	the index of the selected row, -1 (4Test: 0) is returned if no row is selected.
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
VerticalScrollbarPageSize	the block increment value of the scroll bar. (Inherited from IOracleFormsScrollable)
VerticalScrollbarPosition	the current position of the scroll bar. (Inherited from IOracleFormsScrollable)
VerticalScrollbarRange	the range value of the scroll bar. (Inherited from IOracleFormsScrollable)
VerticalScrollbarStepSize	the unit increment value of the scroll bar. (Inherited from IOracleFormsScrollable)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ClearSelection	Clears the selection.

Name	Description
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetCellText	Returns the cell text.
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetColumnName	Returns the name of the column at the specified index.
GetColumnWidth	Returns the width of the specified column.
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetHorizontalScrollbar	Gets the horizontal scroll bar. (Inherited from IOracleFormsScrollable)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetVerticalScrollbar	Gets the vertical scroll bar. (Inherited from IOracleFormsScrollable)
HighlightObject	Highlights this object. (Inherited from TestObject)
HorizontalScrollbarPage	Increments the current scroll position by specified number of pages. (Inherited from IOracleFormsScrollable)
HorizontalScrollbarScrollTo	Scrolls to the specified position. (Inherited from IOracleFormsScrollable)

Name	Description
HorizontalScrollbarScrollToMax	Scrolls to the maximum position of the scroller. (Inherited from IOracleFormsScrollable)
HorizontalScrollbarScrollToMin	Scrolls to the minimum position of the scroller. (Inherited from IOracleFormsScrollable)
HorizontalScrollbarStep	Increments the current scroll position by specified steps. (Inherited from IOracleFormsScrollable)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
IsRowVisible	Returns whether the specified row is visible.
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
ScrollToRow	Scrolls to the specified row.
SelectRow	Selects the specified row.
SetColumnWidth	Sets the width of the specified column.

Name	Description
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
VerticalScrollbarPage	Increments the current scroll position by specified number of pages. (Inherited from IOracleFormsScrollable)
VerticalScrollbarScrollTo	Scrolls to the specified position. (Inherited from IOracleFormsScrollable)
VerticalScrollbarScrollToMax	Scrolls to the maximum position of the scroller. (Inherited from IOracleFormsScrollable)
VerticalScrollbarScrollToMin	Scrolls to the minimum position of the scroller. (Inherited from IOracleFormsScrollable)
VerticalScrollbarStep	Increments the current scroll position by specified steps. (Inherited from IOracleFormsScrollable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)

Name	Description
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

OracleFormsMenu Class

Description

Represents a top-level menu.

Inheritance Hierarchy

- [OracleFormsContainer](#)
 - OracleFormsMenu
 - [OracleFormsPopupMenu](#)

Syntax

```
'Declaration
Public Class OracleFormsMenu _
Inherits OracleFormsContainer _
Implements IOracleFormsMenuBase
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Checked	Whether the MenuItem is checked. (Inherited from IOracleFormsMenuBase)

Name	Description
<i>Cursor</i>	The name of the cursor set in the component. (Inherited from AWTComponent)
<i>Enabled</i>	whether the component is enabled. (Inherited from AWTComponent)
<i>Focusable</i>	whether the component can be focused. (Inherited from AWTComponent)
<i>Font</i>	The font of the component. (Inherited from AWTComponent)
<i>Foreground</i>	The foreground color of the component. (Inherited from AWTComponent)
<i>Height</i>	The current height of the component. (Inherited from AWTComponent)
<i>Name</i>	The name of the component. (Inherited from AWTComponent)
<i>NativeHandle</i>	The native window handle for the object. (Inherited from INativeWindow)
<i>Text</i>	The text of the control. (Inherited from TestObject)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
<i>Width</i>	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
<i>Check</i>	Checks a menu item
<i>Click</i>	Clicks on the object. (Inherited from IClickable)
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from IClickable)
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from TestObject)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from TestObject)

Name	Description
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsChecked	a value that indicates whether the MenuItem is checked.
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
Select	Selects a menu item
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
Uncheck	Unchecks a menu item
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider

Name	Description
WaitForObject	increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

OracleFormsMenuItem Class

Description

Represents a selectable item inside a Menu.

Inheritance Hierarchy

- [OracleFormsContainer](#)
 - OracleFormsMenuItem

Syntax

```
'Declaration
Public Class OracleFormsMenuItem _
Inherits OracleFormsContainer _
Implements IOracleFormsMenuBase
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Checked	Whether the MenuItem is checked. (Inherited from IOracleFormsMenuBase)

Name	Description
<i>Cursor</i>	The name of the cursor set in the component. (Inherited from AWTComponent)
<i>Enabled</i>	whether the component is enabled. (Inherited from AWTComponent)
<i>Focusable</i>	whether the component can be focused. (Inherited from AWTComponent)
<i>Font</i>	The font of the component. (Inherited from AWTComponent)
<i>Foreground</i>	The foreground color of the component. (Inherited from AWTComponent)
<i>Height</i>	The current height of the component. (Inherited from AWTComponent)
<i>Name</i>	The name of the component. (Inherited from AWTComponent)
<i>NativeHandle</i>	The native window handle for the object. (Inherited from INativeWindow)
<i>Text</i>	The text of the control. (Inherited from TestObject)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
<i>Width</i>	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. An exception is thrown if the timeout is reached. (Inherited from TestObject)

OracleFormsPopList Class

Description

Represents a PopList.

Inheritance Hierarchy

- [OracleFormsChoice](#)
 - OracleFormsPopList

Syntax

```
'Declaration
Public Class OracleFormsPopList _
Inherits OracleFormsChoice
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)

Name	Description
DropDownOpen	whether the drop down is currently open.
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
ItemCount	the number of items in the choice. (Inherited from OracleFormsChoice)
Items	the list of choice items. (Inherited from OracleFormsChoice)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
SelectedIndex	the index of the selected item. -1 (4Test: 0) is returned, if no item is currently selected. (Inherited from OracleFormsChoice)
SelectedItem	the selected item. (Inherited from OracleFormsChoice)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. Name	Description
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
Select	Selects a menu item (Inherited from OracleFormsMenu)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
Uncheck	Unchecks a menu item (Inherited from OracleFormsMenu)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown.

Name	Description
	The default timeout is 5 seconds and you can change the timeout by setting the value of the option <i>OPT_WAIT_RESOLVE_OBJDEF</i> . Use <i>WaitForObject</i> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <i>WaitForObject</i> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <i>WaitForObject</i> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <i>OPT_WAIT_RESOLVE_OBJDEF</i> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <i>OPT_WAIT_RESOLVE_OBJDEF</i> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <i>OPT_WAIT_RESOLVE_OBJDEF</i> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

OracleFormsRadioButton Class

Description

Represents a radio button.

Inheritance Hierarchy

- *OracleFormsContainer*
 - OracleFormsRadioButton

Syntax

```
'Declaration
Public Class OracleFormsRadioButton _
Inherits OracleFormsContainer
```

Properties

Name	Description
<i>AccessibleName</i>	The accessible name of the component. (Inherited from <i>AWTComponent</i>)

Name	Description
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Checked	Whether the radio button is checked.
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Check	Checks the radio button.
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is

Name	Description
	specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)

Name	Description
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider

Name	Description
WaitForObject	increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

OracleFormsScrollbar Class

Description

Represents a scroll bar.

Inheritance Hierarchy

- [OracleFormsContainer](#)
 - OracleFormsScrollbar
 - [OracleFormsHorizontalScrollbar](#)
 - [OracleFormsVerticalScrollbar](#)

Syntax

```
'Declaration
Public Class OracleFormsScrollbar _
Inherits OracleFormsContainer _
Implements IOracleFormsScroller
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)

Name	Description
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
PageSize	the block increment value of the scroll bar. (Inherited from IOracleFormsScroller)
Position	the current position of the scroll bar. (Inherited from IOracleFormsScroller)
Range	the range value of the scroll bar. (Inherited from IOracleFormsScroller)
StepSize	the unit increment value of the scroll bar. (Inherited from IOracleFormsScroller)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. <i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)

Name	Description
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
Page	Increments the current scroll position by specified number of pages. (Inherited from IOracleFormsScroller)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
ScrollTo	Scrolls to the specified position. (Inherited from IOracleFormsScroller)
ScrollToMax	Scrolls to the maximum position of the scroller. (Inherited from IOracleFormsScroller)
ScrollToMin	Scrolls to the minimum position of the scroller. (Inherited from IOracleFormsScroller)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
Step	Increments the current scroll position by specified steps. (Inherited from IOracleFormsScroller)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
WaitForDisappearance	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject) Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

OracleFormsStatusArea Class

Description

Represents the area containing status information.

Inheritance Hierarchy

- [OracleFormsContainer](#)
 - OracleFormsStatusArea

Syntax

```
'Declaration  
Public Class OracleFormsStatusArea _  
Inherits OracleFormsContainer
```

Properties

Name	Description

TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object,

Name	Description
	for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

OracleFormsStatusBarItem Class

Description

Represents an item within a status bar.

Inheritance Hierarchy

- [OracleFormsContainer](#)
 - OracleFormsStatusBarItem

Syntax

```
'Declaration
Public Class OracleFormsStatusBarItem _
Inherits OracleFormsContainer
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)

Name	Description
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)

Name	Description
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . <i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)

Name	Description
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

OracleFormsTabPanel Class

Description

Represents a container class for components.

Inheritance Hierarchy

- [OracleFormsContainer](#)
 - OracleFormsTabPanel

Syntax

```
'Declaration
Public Class OracleFormsTabPanel _
Inherits OracleFormsContainer
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Name	Description
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)

Name	Description
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)

Name	Description
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

OracleFormsTextField Class

Description

Represents an Oracle Forms text field.

Inheritance Hierarchy

- [OracleFormsContainer](#)
 - OracleFormsTextField

Syntax

```
'Declaration
Public Class OracleFormsTextField _
Inherits OracleFormsContainer _
Implements IOracleFormsScrollable
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
CaretPosition	the position of the text insertion caret for the text field.
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Editable	whether the text of the text field can be changed by the user.
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
HorizontalScrollbarPageSize	the block increment value of the scroll bar. (Inherited from IOracleFormsScrollable)
HorizontalScrollbarPosition	the current position of the scroll bar. (Inherited from IOracleFormsScrollable)
HorizontalScrollbarRange	the range value of the scroll bar. (Inherited from IOracleFormsScrollable)
HorizontalScrollbarStepSize	the unit increment value of the scroll bar. (Inherited from IOracleFormsScrollable)
IsPassword	whether the text field is a password text field.
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)

Name	Description
PasswordChar	the character that is displayed instead of the characters that are actually typed, if the text field is a password text field.
SelectedText	the current selected text.
SelectionEnd	the end position of the selected text.
SelectionStart	the start position of the selected text.
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
VerticalScrollbarPageSize	the block increment value of the scroll bar. (Inherited from IOracleFormsScrollable)
VerticalScrollbarPosition	the current position of the scroll bar. (Inherited from IOracleFormsScrollable)
VerticalScrollbarRange	the range value of the scroll bar. (Inherited from IOracleFormsScrollable)
VerticalScrollbarStepSize	the unit increment value of the scroll bar. (Inherited from IOracleFormsScrollable)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant System.Drawing.Imaging.PixelFormat.Format32bppRgb can be used for this purpose. (Inherited from TestObject)
Clear	Removes all the text from the text field.
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)

Name	Description
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetHorizontalScrollbar	Gets the horizontal scroll bar. (Inherited from IOracleFormsScrollable)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetVerticalScrollbar	Gets the vertical scroll bar. (Inherited from IOracleFormsScrollable)
HighlightObject	Highlights this object. (Inherited from TestObject)
HorizontalScrollbarPage	Increments the current scroll position by specified number of pages. (Inherited from IOracleFormsScrollable)
HorizontalScrollbarScrollTo	Scrolls to the specified position. (Inherited from IOracleFormsScrollable)
HorizontalScrollbarScrollToMax	Scrolls to the maximum position of the scroller. (Inherited from IOracleFormsScrollable)
HorizontalScrollbarScrollToMin	Scrolls to the minimum position of the scroller. (Inherited from IOracleFormsScrollable)
HorizontalScrollbarStep	Increments the current scroll position by specified steps. (Inherited from IOracleFormsScrollable)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)

Name	Description
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
SelectAll	Selects all the text in the text field.
SetCaretPosition	Sets the position of the text insertion caret for this text field.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
SetSelectionRange	Selects the text within the specified range.
SetText	Sets the text of the text field to the specified text.
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
VerticalScrollbarPage	Increments the current scroll position by specified number of pages. (Inherited from IOracleFormsScrollable)

Name	Description
<i>VerticalScrollbarScrollTo</i>	Scrolls to the specified position. (Inherited from <i>IOracleFormsScrollable</i>)
<i>VerticalScrollbarScrollToMax</i>	Scrolls to the maximum position of the scroller. (Inherited from <i>IOracleFormsScrollable</i>)
<i>VerticalScrollbarScrollToMin</i>	Scrolls to the minimum position of the scroller. (Inherited from <i>IOracleFormsScrollable</i>)
<i>VerticalScrollbarStep</i>	Increments the current scroll position by specified steps. (Inherited from <i>IOracleFormsScrollable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

OracleFormsTitleBar Class

Description

Represents a title bar.

Inheritance Hierarchy

- [OracleFormsContainer](#)
 - OracleFormsTitleBar

Syntax

```
'Declaration

Click	Clicks on the object. (Inherited from IClickable)

Name	Description
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)

Name	Description
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

OracleFormsToolBarItem Class

Description

Represents an element in a toolbar.

Inheritance Hierarchy

- [OracleFormsContainer](#)
 - OracleFormsToolBarItem

Syntax

```
'Declaration
Public Class OracleFormsToolBarItem _
Inherits OracleFormsContainer
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the

An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

OracleFormsTree Class

Description

Represents a tree.

Inheritance Hierarchy

- *OracleFormsContainer*
 - OracleFormsTree

Syntax

```
'Declaration
Public Class OracleFormsTree _
Inherits OracleFormsContainer _
Implements IOracleFormsScrollable
```

Properties

Name	Description
<i>AccessibleName</i>	The accessible name of the component. (Inherited from <i>AWTComponent</i>)

Name	Description
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
HorizontalScrollbarPageSize	the block increment value of the scroll bar. (Inherited from IOracleFormsScrollable)
HorizontalScrollbarPosition	the current position of the scroll bar. (Inherited from IOracleFormsScrollable)
HorizontalScrollbarRange	the range value of the scroll bar. (Inherited from IOracleFormsScrollable)
HorizontalScrollbarStepSize	the unit increment value of the scroll bar. (Inherited from IOracleFormsScrollable)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
SelectedItemPath	the list of selected item path.
SelectedItemText	the selected item text.
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
VerticalScrollbarPageSize	the block increment value of the scroll bar. (Inherited from IOracleFormsScrollable)
VerticalScrollbarPosition	the current position of the scroll bar. (Inherited from IOracleFormsScrollable)
VerticalScrollbarRange	the range value of the scroll bar. (Inherited from IOracleFormsScrollable)
VerticalScrollbarStepSize	the unit increment value of the scroll bar. (Inherited from IOracleFormsScrollable)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
ClickItem	Clicks on a tree node specified by the item path.
Collapse	Collapses the tree node identified by the specified item path.
CollapseAll	Collapses all tree nodes.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DoubleClickItem	Double-clicks on a tree node specified by the item path.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Expand	Expands the tree node identified by the specified item path.
ExpandAll	Expands all tree nodes.
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetHorizontalScrollbar	Gets the horizontal scroll bar. (Inherited from IOracleFormsScrollable)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)

Name	Description
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetVerticalScrollbar	Gets the vertical scroll bar. (Inherited from IOracleFormsScrollable)
HighlightObject	Highlights this object. (Inherited from TestObject)
HorizontalScrollbarPage	Increments the current scroll position by specified number of pages. (Inherited from IOracleFormsScrollable)
HorizontalScrollbarScrollTo	Scrolls to the specified position. (Inherited from IOracleFormsScrollable)
HorizontalScrollbarScrollToMax	Scrolls to the maximum position of the scroller. (Inherited from IOracleFormsScrollable)
HorizontalScrollbarScrollToMin	Scrolls to the minimum position of the scroller. (Inherited from IOracleFormsScrollable)
HorizontalScrollbarStep	Increments the current scroll position by specified steps. (Inherited from IOracleFormsScrollable)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsExpanded	Returns 'true' if the specified item path is expanded.
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
IsVisible	Returns 'true' if the specified item path is visible.
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)

Name	Description
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
ScrollItemIntoView	Scrolls the given item path to a visible position.
Select	Selects a tree node identified by the specified item path.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
VerticalScrollbarPage	Increments the current scroll position by specified number of pages. (Inherited from IOracleFormsScrollable)
VerticalScrollbarScrollTo	Scrolls to the specified position. (Inherited from IOracleFormsScrollable)
VerticalScrollbarScrollToMax	Scrolls to the maximum position of the scroller. (Inherited from IOracleFormsScrollable)
VerticalScrollbarScrollToMin	Scrolls to the minimum position of the scroller. (Inherited from IOracleFormsScrollable)
VerticalScrollbarStep	Increments the current scroll position by specified steps. (Inherited from IOracleFormsScrollable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

OracleFormsVerticalScrollbar Class

Description

Represents a vertical scroll bar.

Inheritance Hierarchy

- [OracleFormsScrollbar](#)
 - OracleFormsVerticalScrollbar

Syntax

```
'Declaration
Public Class OracleFormsVerticalScrollbar _
Inherits OracleFormsScrollbar
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
PageSize	the block increment value of the scroll bar. (Inherited from IOracleFormsScroller)
Position	the current position of the scroll bar. (Inherited from IOracleFormsScroller)
Range	the range value of the scroll bar. (Inherited from IOracleFormsScroller)
StepSize	the unit increment value of the scroll bar. (Inherited from IOracleFormsScroller)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding.

Name	Description
	In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)

Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this <code>TestObject</code> . (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)

Name	Description
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from AWTComponent)
Page	Increments the current scroll position by specified number of pages. (Inherited from IOracleFormsScroller)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from AWTComponent)
ScrollTo	Scrolls to the specified position. (Inherited from IOracleFormsScroller)
ScrollToMax	Scrolls to the maximum position of the scroller. (Inherited from IOracleFormsScroller)
ScrollToMin	Scrolls to the minimum position of the scroller. (Inherited from IOracleFormsScroller)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
Step	Increments the current scroll position by specified steps. (Inherited from IOracleFormsScroller)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)

Name	Description
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

SplitPaneDivider Class

Description

Represents a split pane divider.

Inheritance Hierarchy

- [AWTContainer](#)
 - SplitPaneDivider

Syntax

```
'Declaration  
Public Class SplitPaneDivider _  
Inherits AWTContainer
```

Properties

Name	Description
AccessibleName	The accessible name of the component. (Inherited from AWTComponent)
AccessibleRole	The accessible role of the component. (Inherited from AWTComponent)
Background	The background color of the component. (Inherited from AWTComponent)
Cursor	The name of the cursor set in the component. (Inherited from AWTComponent)
Enabled	whether the component is enabled. (Inherited from AWTComponent)
Focusable	whether the component can be focused. (Inherited from AWTComponent)
Font	The font of the component. (Inherited from AWTComponent)
Foreground	The foreground color of the component. (Inherited from AWTComponent)
Height	The current height of the component. (Inherited from AWTComponent)
Name	The name of the component. (Inherited from AWTComponent)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Width	The current width of the component. (Inherited from AWTComponent)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha

Name	Description
	channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this <code>TestObject</code> . (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)

Name	Description
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>OpenContextMenu</i>	Opens a context menu at the specified position. (Inherited from <i>AWTComponent</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ScrollIntoView</i>	Scrolls the component into view if it is hidden and a child of a scroll pane. (Inherited from <i>AWTComponent</i>)
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

Name	Description
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Win32 Class Reference

Lists the available classes for testing Windows API-based controls.

AccessibleControl Class

Description

The class controls identified by the Accessibility extension.

Inheritance Hierarchy

- [BaseGuiTestObject](#)
 - `AccessibleControl`

Syntax

```
'Declaration  
Public Class AccessibleControl _  
Inherits BaseGuiTestObject
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from GuiTestObject)
Description	The description text of the accessible object.
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Role	The role of this accessible object.
State	The state string that describes the different states of this accessible object.
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoDefaultAction	Executes the default action of the underlying accessible control supports a default action.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)

Name	Description
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>GetHorizontalBar</i>	Returns the horizontal scroll bar for this control. (Inherited from <i>IScrollable</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>GetVerticalBar</i>	Returns the vertical scroll bar for this control. (Inherited from <i>IScrollable</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)

Name	Description
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>OpenContextMenu</i>	Opens a context menu at the specified position. (Inherited from <i>BaseGuiTestObject</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

Name	Description
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Header Class

Description

The class for list header controls. Headers are most commonly used in controls of the `ListViewW32` class.

Inheritance Hierarchy

- [Control](#)
 - Header

Syntax

```
'Declaration
Public Class Header _
Inherits Control
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from GuiTestObject)
ColumnCount	The number of columns in the header.
ColumnOrder	The header's item indices as they are currently ordered.
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DividerDoubleSelect	Double-clicks the divider on the right side of the specified item.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DoubleSelect	Double-clicks an item.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)

Name	Description
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetColumnName	Returns the title of a specified header item.
GetColumnWidth	Returns the width of a specified column.
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from IScrollable)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from IScrollable)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)

Name	Description
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from BaseGuiTestObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Resize	Resizes an item of the header.
Select	Selects an item or button.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use

Name	Description
	WaitForObject if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a WaitForObject, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding WaitForObject statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Listview Class

Description

The class for elaborated list controls that support multiple ways of viewing a list of nonhierarchical data. These views include large and small rearrangable icons and a detail (or report) view.

Inheritance Hierarchy

- [Control](#)
 - ListView

Syntax

```
'Declaration
Public Class ListView _
Inherits Control
```

Properties

Name	Description
AllowsCheck	Whether this list view supports checking items.
AllowsMultiSelect	Whether the list view supports selecting multiple items.

Name	Description
Background	The background color of the GUI object. (Inherited from GuiTestObject)
CheckedIndices	A list containing the indices of the checked items.
CheckedItems	A list containing the checked items.
ColumnCount	The number of columns per item.
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
ItemCount	The number of items contained in the list view.
Items	A list containing all items of the listview.
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
SelectedIndices	A list containing the indices of the selected items.
SelectedItems	A list containing the selected items.
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Check	Checks an item.
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DoubleSelect	Double-clicks an item.

Name	Description
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
ExtendSelect	Selects a range of items by extending the selection in the extend-selection listview.
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetContents	Returns the contents of a listview control. Each returned item is delimited by a semicolon. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from IScrollable)
GetItemImageIndex	Returns the index into the image list of a list view that contains icons. This allows to verify that the correct image is used for an item.
GetItemIndex	Returns the index of the list view item or -1 if is not found.
GetItemRect	Returns rectangle of the item. If <code>getIconRect</code> is set then the rectangle of the icon of the item will be returned otherwise the rectangle of the item text is returned. If a <code>columnIndex</code> is specified the rectangle of this column is returned.
GetItemText	Returns the text of an item.
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from IScrollable)
HighlightObject	Highlights this object. (Inherited from TestObject)

Name	Description
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MultiSelect	Adds an item in the list to the set of currently selected items.
MultiUnselect	Removes an item in the list from the set of selected items.
OpenContextMenu	Opens a context menu at the specified position. (Inherited from BaseGuiTestObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Select	Selects an item.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetItemFocus	Gives focus to the item in the list.
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)

Name	Description
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
Uncheck	Unchecks an item.
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

MonthCalendar Class

Description

The class that selects the calendar date and time.

Inheritance Hierarchy

- [Control](#)
 - MonthCalendar

Syntax

```
'Declaration  
Public Class MonthCalendar _  
Inherits Control
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from GuiTestObject)
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)

Name	Description
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
ExtendSelect	Selects a range of dates and times.
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from IScrollable)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from IScrollable)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)

Name	Description
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from BaseGuiTestObject)
OpenMonthMenu	Opens a calendar menu to a specific month.
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Select	Selects a date and time.
SelectNextMonth	Selects the next month.
SelectPreviousMonth	Selects the previous month.
SelectToday	Selects the date for today.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)

Name	Description
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Pager Class

Description

The class for tabbed, multi-page dialogs and for button bars. On Windows, this class corresponds to the `TabControl` control. On Windows, Silk Test only supports major tabs; it does not support minor tabs (also called 'subpages' or 'child pages').

Inheritance Hierarchy

- [Control](#)

Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from BaseGuiTestObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)

Name	Description
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

UpDown Class

Description

The class for up/down controls.

Inheritance Hierarchy

- [Control](#)
 - UpDown
 - [NumericUpDown](#)

Syntax

```
'Declaration  
Public Class UpDown _  
Inherits Control
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from GuiTestObject)
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
Horizontal	Whether the up/down control is horizontal.
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Position	The position for the up/down control.
Range	The range of the up/down control.
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)
WrapAround	Whether values are wrapped if smaller than minimum or larger than maximum.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
Decrement	Decreases the position value of the up/down control.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject . (Inherited from TestObject)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from IScrollable)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from IScrollable)

Name	Description
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Increment</i>	Increases the position value of the up/down control.
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>OpenContextMenu</i>	Opens a context menu at the specified position. (Inherited from <i>BaseGuiTestObject</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)

Name	Description
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Windows Forms Class Reference

Lists the available classes for testing Windows Forms controls.

CheckedListBox Class

Description

CheckedListBox represents list boxes that contain a check box.

Inheritance Hierarchy

- [ListBox](#)
 - CheckedListBox

Syntax

```
'Declaration  
Public Class CheckedListBox _  
Inherits ListBox
```

Properties

Name	Description
AllowsMultiSelect	Whether the control supports selecting multiple items. (Inherited from ListBox)
Background	The background color of the GUI object. (Inherited from GuiTestObject)
CheckedIndices	The indices of the checked item(s).
CheckedItems	The names of the checked item(s).
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
ItemCount	The number of items in the list box. (Inherited from ListBox)
Items	A list of items in the list box. (Inherited from ListBox)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
SelectedIndex	The index of the first selected item. (Inherited from ListBox)
SelectedIndices	The indices of the selected item(s). (Inherited from ListBox)
SelectedItem	The name of the first selected item. (Inherited from ListBox)
SelectedItems	The names of the selected item(s). (Inherited from ListBox)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this

Name	Description
	property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Check	Selects an item from the checked list box.
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DoubleSelect	Double-clicks an item in the list box. (Inherited from ListBox)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
ExtendSelect	Selects a range of items by extending the selection in the list box. (Inherited from ListBox)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject . (Inherited from TestObject)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from IScrollable)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)

Name	Description
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>GetVerticalBar</i>	Returns the vertical scroll bar for this control. (Inherited from <i>IScrollable</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>MultiSelect</i>	Selects an item in the multi- or extend-selection list box. (Inherited from <i>ListBox</i>)
<i>MultiUnselect</i>	Unselects an item in the multi- or extend-selection list box. (Inherited from <i>ListBox</i>)
<i>OpenContextMenu</i>	Opens a context menu at the specified position. (Inherited from <i>BaseGuiTestObject</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)

Name	Description
Select	Selects an item from the list box. (Inherited from ListBox)
SelectRange	Selects a range of items in the extend-selection list box. (Inherited from ListBox)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
Uncheck	Selects an item from the checked list box.
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

DataGrid Class

Description

The class for datagrids and data grid view.

Inheritance Hierarchy

- [Control](#)
 - DataGrid

Syntax

```
'Declaration
Public Class DataGrid _
Inherits Control
```

Properties

Name	Description
AllowsMultiSelect	Whether the table supports selecting multiple items.
Background	The background color of the GUI object. (Inherited from GuiTestObject)
ColumnCount	The number of columns in the DataGrid.
ColumnItems	A list of all items in the column.
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
Items	A list of all items in the column.
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)

Name	Description
RowCount	The number of rows in the DataGrid.
RowItems	A list of all items in the row.
SelectedItems	The selected item(s).
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
DoubleSelectedItem	Double-clicks an item.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
ExtendSelectedItem	Expands the selection to the given item.
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)

Name	Description
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from <i>IScrollable</i>)
GetParent	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
GetProperty	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from <i>IScrollable</i>)
HighlightObject	Highlights this object. (Inherited from <i>TestObject</i>)
ImageClick	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
ImageClickFile	Clicks on the specified image. (Inherited from <i>TestObject</i>)
ImageExists	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
ImageExistsFile	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
Invoke	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
InvokeMethods	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
IsFocused	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
MultiSelectItem	Adds a row from the table to the set of selected rows.
MultiUnselectItem	Removes a item from the set of selected items.
OpenContextMenu	Opens a context menu at the specified position. (Inherited from <i>BaseGuiTestObject</i>)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Tries to bring the item to the top left corner of the datagrid.
SelectAllItems	Selects all items in the datagrid.
SelectItem	Selects an item.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)

Name	Description
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

DataGridColumn Class

Description

The class for columns in a table.

Inheritance Hierarchy

- [*Item*](#)
 - DataGridColumn

Syntax

```
'Declaration
Public Class DataGridColumn _
Inherits Item
```

Properties

Name	Description
<i>Background</i>	The background color of the GUI object. (Inherited from <i>GuiTestObject</i>)
<i>Enabled</i>	Whether the GUI object is enabled. (Inherited from <i>GuiTestObject</i>)
<i>Font</i>	The font type of the GUI object. (Inherited from <i>GuiTestObject</i>)
<i>Foreground</i>	The foreground color of the GUI object. (Inherited from <i>GuiTestObject</i>)
<i>NativeHandle</i>	The native window handle for the object. (Inherited from <i>INativeWindow</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)

Name	Description
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)
Width	The width of the column.

Methods

Name	Description
AutoSize	Automatically resizes a column by double clicking its divider.
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)

Name	Description
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>Resize</i>	Resizes a column.
<i>ScrollIntoView</i>	Tries to bring the column to the left by scrolling the data grid.
<i>Select</i>	Selects a column.
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)

Name	Description
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

DataGridItem Class

Description

The class for datagrids and data grid view rows.

Inheritance Hierarchy

- [Item](#)
 - DataGridItem

Syntax

```
'Declaration  
Public Class DataGridItem _  
Inherits Item
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from GuiTestObject)
Column	The column of the item in the data grid
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Row	The row of the item in the data grid
Selected	Whether the item is selected.
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha

Name	Description
	channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this <code>TestObject</code> . (Inherited from TestObject)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)

Name	Description
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ScrollIntoView</i>	Tries to bring the item to the top left corner of the datagrid.
<i>Select</i>	Selects an item.
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)

GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Resize	Resizes a column.
ScrollIntoView	Tries to bring the row to the top by scrolling the data grid.
Select	Selects a column.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)

Name	Description
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

DomainUpDown Class

Description

The class for up/down controls.

Inheritance Hierarchy

- [Control](#)
 - DomainUpDown

Syntax

```
'Declaration
Public Class DomainUpDown _
Inherits Control
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from GuiTestObject)
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
ItemCount	The number of items contained in the list view.
Items	The items in the domain up/down control.

Name	Description
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
SelectedIndex	The position for the up/down control.
SelectedItem	The position for the up/down control.
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)
WrapAround	Whether values are wrapped if smaller than minimum or larger than maximum.

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
Decrement	Decreases the position value of the up/down control.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)

Name	Description
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>GetHorizontalBar</i>	Returns the horizontal scroll bar for this control. (Inherited from <i>IScrollable</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>GetVerticalBar</i>	Returns the vertical scroll bar for this control. (Inherited from <i>IScrollable</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Increment</i>	Increases the position value of the up/down control.
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>OpenContextMenu</i>	Opens a context menu at the specified position. (Inherited from <i>BaseGuiTestObject</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)

Name	Description
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Select	Selects an item.
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
WaitForPropertyNotEquals	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

ElementHost Class

Description

A Windows Forms control that can be used to host a Windows Presentation Foundation (WPF) element.

Inheritance Hierarchy

- [Control](#)
 - ElementHost

Syntax

```
'Declaration
Public Class ElementHost _
Inherits Control
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from GuiTestObject)
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)

Name	Description
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from IScrollable)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from IScrollable)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from BaseGuiTestObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)

Name	Description
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForScreenshotStable</i>	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

FormsHost Class

Description

An element that allows you to host a Windows Forms control on a WPF page.

Inheritance Hierarchy

- [Control](#)
 - FormsHost

Syntax

```
'Declaration  
Public Class FormsHost _  
Inherits Control
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from GuiTestObject)
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)

FormsWindow Class

Description

FormsWindow is the class that represents the top-level window of a Windows Forms application.

Inheritance Hierarchy

- [Window](#)
 - FormsWindow

Syntax

```
'Declaration
Public Class FormsWindow _
Inherits Window
```

Properties

Name	Description
Application	The name of the Application that this Window belongs to. (Inherited from Window)
Background	The background color of the GUI object. (Inherited from GuiTestObject)
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)
WindowState	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from IMoveable)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
Close	Closes the window. (Inherited from IMoveable)
CloseSynchron	Closes the window and waits until the window is closed. (Inherited from IMoveable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)

Name	Description
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetCloseWindows</i>	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from <i>IMoveable</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>GetFocus</i>	Returns the object with the input focus. (Inherited from <i>IMoveable</i>)
<i>GetHorizontalBar</i>	Returns the horizontal scroll bar for this control. (Inherited from <i>IScrollable</i>)
<i>GetNextCloseWindow</i>	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from <i>IMoveable</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>GetVerticalBar</i>	Returns the vertical scroll bar for this control. (Inherited from <i>IScrollable</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)

Name	Description
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsActive	Returns whether the window is set to active. (Inherited from IMoveable)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
LoadAssembly	Loads the assembly on the specified path in the Windows Forms application.
Maximize	Maximizes the window. (Inherited from IMoveable)
Minimize	Reduces the window to an icon. (Inherited from IMoveable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the window. (Inherited from IMoveable)
OpenContextMenu	Opens a context menu at the specified position. (Inherited from BaseGuiTestObject)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Restore	Restores the window to its previous size. (Inherited from IMoveable)
SetActive	Makes the window active. (Inherited from IMoveable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
Size	Resizes the window. (Inherited from IMoveable)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)

Name	Description
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

MenuStrip Class

Description

MenuStrip is the class that creates a new menu strip for a Windows Forms application.

Inheritance Hierarchy

- [Control](#)
 - MenuStrip

Syntax

```
'Declaration
Public Class MenuStrip _
Inherits Control
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from GuiTestObject)
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)

An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

NumericUpDown Class

Description

The class for numeric up/down controls.

Inheritance Hierarchy

- [UpDown](#)
 - NumericUpDown

Syntax

```
'Declaration
Public Class NumericUpDown _
Inherits UpDown
```

Properties

Name	Description
Background	The background color of the GUI object. (Inherited from GuiTestObject)
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)

Name	Description
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
Horizontal	Whether the up/down control is horizontal. (Inherited from UpDown)
Maximum	The maximum value of the up/down control.
Minimum	The minimum value of the up/down control.
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Position	The position for the up/down control. (Inherited from UpDown)
PositionDecimal	The position for the up/down control.
Range	The range of the up/down control. (Inherited from UpDown)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)
WrapAround	Whether values are wrapped if smaller than minimum or larger than maximum. (Inherited from UpDown)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
Decrement	Decreases the position value of the up/down control. (Inherited from UpDown)
DecrementDecimal	Decreases the position value of the up/down control.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)

Name	Description
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>GetHorizontalBar</i>	Returns the horizontal scroll bar for this control. (Inherited from <i>IScrollable</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>GetVerticalBar</i>	Returns the vertical scroll bar for this control. (Inherited from <i>IScrollable</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Increment</i>	Increases the position value of the up/down control. (Inherited from <i>UpDown</i>)
<i>IncrementDecimal</i>	Increases the position value of the up/down control.
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)

Name	Description
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <i>TestObject</i>)
<i>IsFocused</i>	Return whether the control has focus. (Inherited from <i>IFocusable</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>OpenContextMenu</i>	Opens a context menu at the specified position. (Inherited from <i>BaseGuiTestObject</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>IFocusable</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by

Name	Description
	setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

xBrowser Class Reference

Lists the available classes for testing xBrowser controls.

BrowserApplication Class

Description

Represents the top-level window of a browser application.

Note: `BrowserApplication` is derived from `BaseGuiTestObject` and inherits the two scrollbar methods `GetHorizontalBar` and `GetVerticalBar`. However, these two methods do not work on a `BrowserApplication`.

Inheritance Hierarchy

- [Window](#)
 - `BrowserApplication`

Syntax

```
'Declaration
Public Class BrowserApplication _
Inherits Window
```

Properties

Name	Description
Application	The name of the Application that this Window belongs to. (Inherited from Window)
Background	The background color of the GUI object. (Inherited from GuiTestObject)
Enabled	Whether the GUI object is enabled. (Inherited from GuiTestObject)
Font	The font type of the GUI object. (Inherited from GuiTestObject)
Foreground	The foreground color of the GUI object. (Inherited from GuiTestObject)
NativeHandle	The native window handle for the object. (Inherited from INativeWindow)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from GuiTestObject)
WindowState	The state of a window. Values include: 1=minimized, 2=maximized, 3=restored (Inherited from IMoveable)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
ClearCache	Clears the browser's cache.
Click	Clicks on the object. (Inherited from IClickable)
Close	Closes the window. (Inherited from IMoveable)
CloseOtherTabs	Closes all tabs except the active one. When several tabs are open, Internet Explorer only displays some of the tabs and scroll buttons. This method closes all other tabs except for the selected one, including the tabs that are not currently visible. This method is not supported for mobile Web applications.
CloseSynchron	Closes the window and waits until the window is closed. (Inherited from IMoveable)

Name	Description
CloseTab	Closes the specified tab. If no tab is specified, the active tab is closed. When several tabs are open, Internet Explorer only displays some of the tabs and scroll buttons. As a result, only the currently visible tabs work with this method, which affects index semantics. For example, only the currently visible tabs can be closed. Index 0 identifies the first visible tab. This method is not supported for mobile Web applications.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
ExistsTab	Returns true if the tab exists and false otherwise. This method is not supported for mobile Web applications.
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetActiveTab	Returns the active tab. This method is not supported for mobile Web applications.
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetCloseWindows	Returns the windows that need to be closed in order so that only the main window of the application is open. (Inherited from IMoveable)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetFocus	Returns the object with the input focus. (Inherited from IMoveable)
GetHorizontalBar	Returns the horizontal scroll bar for this control. (Inherited from IScrollable)
GetNextCloseWindow	Returns the next window that need to be closed in order to close all windows of the application except the main window. (Inherited from IMoveable)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetSelectedTab	Returns the currently selected tab. This method is not supported for mobile Web applications.
GetSelectedTabIndex	Returns the index of the active tab. When several tabs are open, Internet Explorer only displays some of the tabs and scroll buttons. As a result, this method only returns the index relative to the currently visible tabs. Index 0 identifies the first visible tab. This method is not supported for mobile Web applications.
GetSelectedTabName	Returns the name of the active tab. This method is not supported for mobile Web applications.
GetTabCount	Returns the number of open tabs. When several tabs are open, Internet Explorer only displays some of the tabs and scroll buttons. As a result, this method only returns the number of currently visible tabs. This method is not supported for mobile Web applications.
GetVerticalBar	Returns the vertical scroll bar for this control. (Inherited from IScrollable)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
IsActive	Returns whether the window is set to active. (Inherited from IMoveable)
IsFocused	Return whether the control has focus. (Inherited from IFocusable)
Maximize	Maximizes the window. (Inherited from IMoveable)
Minimize	Reduces the window to an icon. (Inherited from IMoveable)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
Move	Moves the window. (Inherited from IMoveable)

Name	Description
Navigate	Navigate to the specified URL in the currently active tab/window
OpenContextMenu	Opens a context menu at the specified position. (Inherited from BaseGuiTestObject)
OpenTab	Opens a new tab and navigates to the given URL. If no URL is given, the tab navigates to about:blank. This method is not supported for mobile Web applications.
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
Restore	Restores the window to its previous size. (Inherited from IMoveable)
SelectTab	Selects the specified tab. When several tabs are open, Internet Explorer only displays some of the tabs and scroll buttons. As a result, only the currently visible tabs work with this method, which affects index semantics. For example, only the currently visible tabs can be selected. Index 0 selects the first visible tab. This method is not supported for mobile Web applications.
SetActive	Makes the window active. (Inherited from IMoveable)
SetFocus	Gives focus to the control. (Inherited from IFocusable)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
Size	Resizes the window. (Inherited from IMoveable)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)

Name	Description
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

BrowserObject Class

Description

Base class for all objects that are contained within a `BrowserApplication`.

Inheritance Hierarchy

- [TestObject](#)
 - `BrowserObject`
 - [BrowserWindow](#)
 - [DomElement](#)

Syntax

```
'Declaration
Public Class BrowserObject _
```

Inherits `TestObject` _
Implements `IClickable`, `IKeyable`

Properties

Name	Description
<code>Text</code>	The text of the control. (Inherited from <code>TestObject</code>)
<code>Value</code>	The value of the control, e.g.: text in a text control. (Inherited from <code>TestObject</code>)
<code>Visible</code>	Whether the object is visible. You can only locate visible objects, so by default the value is always <code>true</code> . However, you might need this property when an already located object in the application under test gets invisible during replay.

Methods

Name	Description
<code>CaptureBitmap</code>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from <code>TestObject</code>)
<code>Click</code>	Clicks on the object. (Inherited from <code>IClickable</code>)
<code>DoubleClick</code>	Double-clicks a mouse button on the object. (Inherited from <code>IClickable</code>)
<code>Exists</code>	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from <code>TestObject</code>)
<code>Exists</code>	Checks if an object exists in the application under test. (Inherited from <code>TestObject</code>)
<code>Find</code>	Finds an object specified by an XPath locator. (Inherited from <code>TestObject</code>)
<code>FindAll</code>	Finds all objects specified by an XPath locator. (Inherited from <code>TestObject</code>)
<code>GenerateLocator</code>	Returns a locator for this object. (Inherited from <code>TestObject</code>)
<code>GetChildren</code>	Returns the child objects of this object. (Inherited from <code>TestObject</code>)
<code>GetDynamicMethodList</code>	Returns a list of methods (including their signature) that can be dynamically invoked on this <code>TestObject</code> . (Inherited from <code>TestObject</code>)
<code>GetParent</code>	Looks up the parent of this object in the test application. (Inherited from <code>TestObject</code>)

Name	Description
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>SetFocus</i>	Gives focus to the control.
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)

Name	Description
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

BrowserWindow Class

Description

A browser window is the top-level container for a web page. It exposes the DOM tree through DomElements. E.g. a tab in IE7, an embedded browser control in SWT.

Inheritance Hierarchy

- [BrowserObject](#)
 - BrowserWindow

Syntax

```
'Declaration
Public Class BrowserWindow _
Inherits BrowserObject
```

Properties

Name	Description
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
ViewportHeight	The height of the browser viewport
ViewportName	The name of the viewport that matches the innerWidth and innerHeight of the browser window
ViewportOrientation	The orientation of the browser viewport, this can be portrait or landscape
ViewportWidth	The width of the browser viewport
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from BrowserObject)

Methods

Name	Description
AcceptAlert	Accepts a JavaScript alert by pressing OK.
Back	Goes back in the history.
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)

Name	Description
CaptureFullPageBitmap	Capture a screenshot of the whole web page and save it as a file to the specified path. The filename extension determines the file type. Possible extensions are .jpg, .jpeg, .png, and .bmp.
Click	Clicks on the object. (Inherited from IClickable)
Close	Close a modal browser dialog, a tab of the browser, or the browser itself if it is the last tab (or IE6).
DismissAlert	Dismisses a JavaScript alert.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
ExecuteJavaScript	Evaluates JavaScript code within the top-level document context.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
Forward	Goes forward in the history.
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetAlertText	Retrieves the message text of a JavaScript alert.
GetBrowserMajorVersion	Returns the browser's major version number.
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetHtmlRect	Retrieves the rectangle of the BrowserWindow in HTML pixels. The click function also uses HTML pixel coordinates for all DomElements. We recommend to use GetHtmlRect for all position calculations within the browser. This will ensure that your scripts are cross-browser capable and your position calculations are not affected by changing zoom levels on mobile browsers.
GetPageSource	Returns the page source of the web site
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)

Name	Description
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>GetUrl</i>	Returns the URL for the main document.
<i>GetUserAgent</i>	Returns the browser's user agent string
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>IsAlertPresent</i>	Returns true if a JavaScript alert is open
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>Navigate</i>	Navigates the main document to an URL.
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>Reload</i>	Reloads the main document as the reload button in the browser does.
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>BrowserObject</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)

Name	Description
<i>SetViewportName</i>	Set the size of the browser window to the specified size from your Browser Size list.
<i>SetViewportSize</i>	Sets the size of the browser window to the specified width and height.
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>WaitForChildDisappearance</i>	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForDisappearance</i>	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForObject</i>	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from <i>TestObject</i>)
<i>WaitForProperty</i>	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)
<i>WaitForPropertyNotEquals</i>	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from <i>TestObject</i>)

Name	Description
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

DomButton Class

Description

A `DomButton` represents all DOM elements that were specified using one of the following tags: `<input type='submit'>`, `<input type='reset'>`, `<input type='button'>` or `<button>`.

Inheritance Hierarchy

- [DomElement](#)
 - `DomButton`

Syntax

```
'Declaration
Public Class DomButton _
Inherits DomElement
```

Properties

Name	Description
IsFocused	Whether the DOM element has focus. (Inherited from DomElement)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <code>true</code> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from BrowserObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is <code>%LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps</code> . The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)

Name	Description
Click	Clicks on the object. (Inherited from IClickable)
DomClick	Invokes a click using the DOM API. Alternatively you can invoke the Click function which will use low level replay for DomElements and subclasses. (Inherited from DomElement)
DomDoubleClick	Invokes a double click using the DOM API. Alternatively you can invoke the DoubleClick function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from DomElement)
DomMouseMove	Invokes a mouse move using the DOM API. Alternatively you can use MouseMove function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from DomElement)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
ExecuteJavaScript	Evaluates the given JavaScript code within the parent document's context. (Inherited from DomElement)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetCssStyle	Retrieves the computed CSS style with the specified style name. (Inherited from DomElement)
GetDomAttribute	Gets the value of an object specific DOM attribute. (Inherited from DomElement)
GetDomAttributeList	Returns the names of all DOM attributes that are available for this element. This method is not supported for mobile Web applications. (Inherited from DomElement)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetHtmlRect	Retrieves the rectangle of a DomElement relative to the BrowserWindow in HTML pixels. In contrast to the screen coordinates that are provided by the GetRect function, the coordinates provided by GetHtmlRect are not affected by the zoom level on mobile browsers. The click function also uses HTML pixel coordinates for all

Name	Description
	DomElements. We recommend to use GetHtmlRect for all position calculations within the browser. This will ensure that your scripts are cross-browser capable and your position calculations are not effected by changing zoom levels on mobile browsers. (Inherited from DomElement)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetText	Gets the visible text of a DOM element. (Inherited from DomElement)
Highlight	Highlights a DOM element. (Inherited from DomElement)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)

Name	Description
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the DOM element into the visible area of the browser window. (Inherited from DomElement)
Select	Clicks a button.
SetDomAttribute	Sets the value of an object specific DOM attribute. (Inherited from DomElement)
SetFocus	Gives focus to the control. (Inherited from BrowserObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
Unhighlight	Restores the original foreground and background colors. (Inherited from DomElement)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)

Name	Description
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached.If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

DomCheckBox Class

Description

A DomCheckBox represents all DOM elements that were specified using <input type='checkbox'> tag.

Inheritance Hierarchy

- [DomElement](#)
 - DomCheckBox

Syntax

```
'Declaration
Public Class DomCheckBox _
Inherits DomElement
```

Properties

Name	Description
IsFocused	Whether the DOM element has focus. (Inherited from DomElement)
State	The state of a check box. Values include: 1=checked,2=unchecked, 3=undecided
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from BrowserObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Check	Checks the check box.
Click	Clicks on the object. (Inherited from IClickable)
DomClick	Invokes a click using the DOM API. Alternatively you can invoke the Click function which will use low level replay for DomElements and subclasses. (Inherited from DomElement)
DomDoubleClick	Invokes a double click using the DOM API. Alternatively you can invoke the DoubleClick function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from DomElement)
DomMouseMove	Invokes a mouse move using the DOM API. Alternatively you can use MouseMove function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from DomElement)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
ExecuteJavaScript	Evaluates the given JavaScript code within the parent document's context. (Inherited from DomElement)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetCssStyle	Retrieves the computed CSS style with the specified style name. (Inherited from DomElement)
GetDomAttribute	Gets the value of an object specific DOM attribute. (Inherited from DomElement)

Name	Description
GetDomAttributeList	Returns the names of all DOM attributes that are available for this element. This method is not supported for mobile Web applications. (Inherited from DomElement)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetHtmlRect	Retrieves the rectangle of a DomElement relative to the BrowserWindow in HTML pixels. In contrast to the screen coordinates that are provided by the GetRect function, the coordinates provided by GetHtmlRect are not affected by the zoom level on mobile browsers. The click function also uses HTML pixel coordinates for all DomElements. We recommend to use GetHtmlRect for all position calculations within the browser. This will ensure that your scripts are cross-browser capable and your position calculations are not effected by changing zoom levels on mobile browsers. (Inherited from DomElement)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetText	Gets the visible text of a DOM element. (Inherited from DomElement)
Highlight	Highlights a DOM element. (Inherited from DomElement)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)

Name	Description
IsChecked	Returns <i>true</i> if the checkbox is checked and <i>false</i> otherwise.
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the DOM element into the visible area of the browser window. (Inherited from DomElement)
Select	Selects the check box
SetDomAttribute	Sets the value of an object specific DOM attribute. (Inherited from DomElement)
SetFocus	Gives focus to the control. (Inherited from BrowserObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
SetUndecided	Sets the check box to the undecided state.
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
Toggle	Toggles the state of the check box. If the checkbox is checked it is unchecked and vice versa. If the checkbox is in the undecided state it is left undecided.
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
Uncheck	Unchecks the check box.
Unhighlight	Restores the original foreground and background colors. (Inherited from DomElement)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
WaitForDisappearance	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject) Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an ObjectNotFoundException is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

DomDataList Class

Description

A DomDataList represents an input element with pre-defined values in a `<datalist>` element.

Inheritance Hierarchy

- [DomTextField](#)
 - DomDataList

Syntax

```
'Declaration
Public Class DomDataList _
```

Inherits DomTextField _
Implements IItemSelectable

Properties

Name	Description
IsFocused	Whether the DOM element has focus. (Inherited from DomElement)
IsPassword	whether the text field is a password text field. (Inherited from DomTextField)
ItemCount	the number of items in the listbox. (Inherited from IItemSelectable)
Items	the list of items in the listbox. (Inherited from IItemSelectable)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from BrowserObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant System.Drawing.Imaging.PixelFormat.Format32bppRgb can be used for this purpose. (Inherited from TestObject)
ClearText	Clears the textfield's text (Inherited from DomTextField)
Click	Clicks on the object. (Inherited from IClickable)
DomClick	Invokes a click using the DOM API. Alternatively you can invoke the Click function which will use low level replay for DomElements and subclasses. (Inherited from DomElement)
DomDoubleClick	Invokes a double click using the DOM API. Alternatively you can invoke the DoubleClick function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from DomElement)
DomMouseMove	Invokes a mouse move using the DOM API. Alternatively you can use MouseMove function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from DomElement)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)

Name	Description
ExecuteJavaScript	Evaluates the given JavaScript code within the parent document's context. (Inherited from DomElement)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetCssStyle	Retrieves the computed CSS style with the specified style name. (Inherited from DomElement)
GetDomAttribute	Gets the value of an object specific DOM attribute. (Inherited from DomElement)
GetDomAttributeList	Returns the names of all DOM attributes that are available for this element. This method is not supported for mobile Web applications. (Inherited from DomElement)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetHtmlRect	Retrieves the rectangle of a DomElement relative to the BrowserWindow in HTML pixels. In contrast to the screen coordinates that are provided by the GetRect function, the coordinates provided by GetHtmlRect are not affected by the zoom level on mobile browsers. The click function also uses HTML pixel coordinates for all DomElements. We recommend to use GetHtmlRect for all position calculations within the browser. This will ensure that your scripts are cross-browser capable and your position calculations are not effected by changing zoom levels on mobile browsers. (Inherited from DomElement)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)

Name	Description
GetText	Gets the visible text of a DOM element. (Inherited from DomElement)
Highlight	Highlights a DOM element. (Inherited from DomElement)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the DOM element into the visible area of the browser window. (Inherited from DomElement)
Select	Selects an item. (Inherited from IItemSelectable)
SetDomAttribute	Sets the value of an object specific DOM attribute. (Inherited from DomElement)
SetFocus	Gives focus to the control. (Inherited from BrowserObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
SetText	Sets the text. (Inherited from DomTextField)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)

Name	Description
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
Unhighlight	Restores the original foreground and background colors. (Inherited from DomElement)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

DomElement Class

Description

A DomElement represents any element in the DOM tree.

Inheritance Hierarchy

- [BrowserObject](#)
 - DomElement
 - [DomButton](#)
 - [DomCheckBox](#)
 - [DomEmbeddedElement](#)
 - [DomForm](#)
 - [DomLink](#)
 - [DomListBox](#)
 - [DomRadioButton](#)
 - [DomTable](#)
 - [DomTableRow](#)
 - [DomTextField](#)

Syntax

```
'Declaration
Public Class DomElement _
Inherits BrowserObject
```

Properties

Name	Description
IsFocused	Whether the DOM element has focus.
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from BrowserObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location

Name	Description
	<p>on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)</p>
Click	Clicks on the object. (Inherited from IClickable)
DomClick	Invokes a click using the DOM API. Alternatively you can invoke the Click function which will use low level replay for DomElements and subclasses.
DomDoubleClick	Invokes a double click using the DOM API. Alternatively you can invoke the DoubleClick function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications.
DomMouseMove	Invokes a mouse move using the DOM API. Alternatively you can use MouseMove function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications.
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
ExecuteJavaScript	Evaluates the given JavaScript code within the parent document's context.
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetCssStyle	Retrieves the computed CSS style with the specified style name.
GetDomAttribute	Gets the value of an object specific DOM attribute.
GetDomAttributeList	Returns the names of all DOM attributes that are available for this element. This method is not supported for mobile Web applications.
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)

Name	Description
<i>GetHtmlRect</i>	Retrieves the rectangle of a DomElement relative to the BrowserWindow in HTML pixels. In contrast to the screen coordinates that are provided by the GetRect function, the coordinates provided by GetHtmlRect are not affected by the zoom level on mobile browsers. The click function also uses HTML pixel coordinates for all DomElements. We recommend to use GetHtmlRect for all position calculations within the browser. This will ensure that your scripts are cross-browser capable and your position calculations are not effected by changing zoom levels on mobile browsers.
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>GetText</i>	Gets the visible text of a DOM element.
<i>Highlight</i>	Highlights a DOM element.
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <i>TestObject</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)

Name	Description
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the DOM element into the visible area of the browser window.
SetDomAttribute	Sets the value of an object specific DOM attribute.
SetFocus	Gives focus to the control. (Inherited from BrowserObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
Unhighlight	Restores the original foreground and background colors.
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

DomEmbeddedElement Class

Description

A DOM element that was specified by an <embed> or <object> tag.

Inheritance Hierarchy

- [DomElement](#)
 - DomEmbeddedElement

Syntax

```
'Declaration
Public Class DomEmbeddedElement _
Inherits DomElement
```

Properties

Name	Description
IsFocused	Whether the DOM element has focus. (Inherited from DomElement)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from BrowserObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DomClick	Invokes a click using the DOM API. Alternatively you can invoke the Click function which will use low level replay for DomElements and subclasses. (Inherited from DomElement)
DomDoubleClick	Invokes a double click using the DOM API. Alternatively you can invoke the DoubleClick function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from DomElement)
DomMouseMove	Invokes a mouse move using the DOM API. Alternatively you can use MouseMove function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from DomElement)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
ExecuteJavaScript	Evaluates the given JavaScript code within the parent document's context. (Inherited from DomElement)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetCssStyle	Retrieves the computed CSS style with the specified style name. (Inherited from DomElement)
GetDomAttribute	Gets the value of an object specific DOM attribute. (Inherited from DomElement)

Name	Description
<i>GetDomAttributeList</i>	Returns the names of all DOM attributes that are available for this element. This method is not supported for mobile Web applications. (Inherited from <i>DomElement</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <i>TestObject</i>)
<i>GetHtmlRect</i>	Retrieves the rectangle of a DomElement relative to the BrowserWindow in HTML pixels. In contrast to the screen coordinates that are provided by the GetRect function, the coordinates provided by GetHtmlRect are not affected by the zoom level on mobile browsers. The click function also uses HTML pixel coordinates for all DomElements. We recommend to use GetHtmlRect for all position calculations within the browser. This will ensure that your scripts are cross-browser capable and your position calculations are not effected by changing zoom levels on mobile browsers. (Inherited from <i>DomElement</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>GetText</i>	Gets the visible text of a DOM element. (Inherited from <i>DomElement</i>)
<i>Highlight</i>	Highlights a DOM element. (Inherited from <i>DomElement</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <i>TestObject</i>)

Name	Description
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the DOM element into the visible area of the browser window. (Inherited from DomElement)
SetDomAttribute	Sets the value of an object specific DOM attribute. (Inherited from DomElement)
SetFocus	Gives focus to the control. (Inherited from BrowserObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
Unhighlight	Restores the original foreground and background colors. (Inherited from DomElement)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown.

Name	Description
	The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

DomForm Class

Description

A `DomForm` represents all DOM elements that were specified using the `<form>` tag. All methods and properties in this class are not supported for mobile Web applications.

Inheritance Hierarchy

- [DomElement](#)
 - `DomForm`

Syntax

```
'Declaration
Public Class DomForm _
Inherits DomElement
```

Properties

Name	Description
IsFocused	Whether the DOM element has focus. (Inherited from DomElement)
Text	The text of the control. (Inherited from TestObject)

Name	Description
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from BrowserObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DomClick	Invokes a click using the DOM API. Alternatively you can invoke the Click function which will use low level replay for DomElements and subclasses. (Inherited from DomElement)
DomDoubleClick	Invokes a double click using the DOM API. Alternatively you can invoke the DoubleClick function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from DomElement)
DomMouseMove	Invokes a mouse move using the DOM API. Alternatively you can use MouseMove function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from DomElement)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
ExecuteJavaScript	Evaluates the given JavaScript code within the parent document's context. (Inherited from DomElement)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)

Name	Description
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetCssStyle	Retrieves the computed CSS style with the specified style name. (Inherited from DomElement)
GetDomAttribute	Gets the value of an object specific DOM attribute. (Inherited from DomElement)
GetDomAttributeList	Returns the names of all DOM attributes that are available for this element. This method is not supported for mobile Web applications. (Inherited from DomElement)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetHtmlRect	Retrieves the rectangle of a DomElement relative to the BrowserWindow in HTML pixels. In contrast to the screen coordinates that are provided by the GetRect function, the coordinates provided by GetHtmlRect are not affected by the zoom level on mobile browsers. The click function also uses HTML pixel coordinates for all DomElements. We recommend to use GetHtmlRect for all position calculations within the browser. This will ensure that your scripts are cross-browser capable and your position calculations are not effected by changing zoom levels on mobile browsers. (Inherited from DomElement)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetText	Gets the visible text of a DOM element. (Inherited from DomElement)
Highlight	Highlights a DOM element. (Inherited from DomElement)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)

Name	Description
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the DOM element into the visible area of the browser window. (Inherited from DomElement)
SetDomAttribute	Sets the value of an object specific DOM attribute. (Inherited from DomElement)
SetFocus	Gives focus to the control. (Inherited from BrowserObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
Submit	Submits the form.
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
Unhighlight	Restores the original foreground and background colors. (Inherited from DomElement)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional

Name	Description
WaitForDisappearance	<p>timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)</p> <p>Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)</p>
WaitForObject	<p>Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code>. Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code>, because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)</p>
WaitForProperty	<p>Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)</p>
WaitForPropertyNotEquals	<p>Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)</p>
WaitForScreenshotStable	<p>Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)</p>

DomLink Class

Description

A `DomLink` represents all DOM elements that were specified using the `<a>` tag.

Inheritance Hierarchy

- [DomElement](#)
 - `DomLink`

Syntax

```
'Declaration
Public Class DomLink _
Inherits DomElement
```

Properties

Name	Description
IsFocused	Whether the DOM element has focus. (Inherited from DomElement)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from BrowserObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DomClick	Invokes a click using the DOM API. Alternatively you can invoke the Click function which will use low level replay for DomElements and subclasses. (Inherited from DomElement)
DomDoubleClick	Invokes a double click using the DOM API. Alternatively you can invoke the DoubleClick function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from DomElement)
DomMouseMove	Invokes a mouse move using the DOM API. Alternatively you can use MouseMove function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from DomElement)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
ExecuteJavaScript	Evaluates the given JavaScript code within the parent document's context. (Inherited from DomElement)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is

Name	Description
	specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetCssStyle	Retrieves the computed CSS style with the specified style name. (Inherited from DomElement)
GetDomAttribute	Gets the value of an object specific DOM attribute. (Inherited from DomElement)
GetDomAttributeList	Returns the names of all DOM attributes that are available for this element. This method is not supported for mobile Web applications. (Inherited from DomElement)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetHtmlRect	Retrieves the rectangle of a DomElement relative to the BrowserWindow in HTML pixels. In contrast to the screen coordinates that are provided by the GetRect function, the coordinates provided by GetHtmlRect are not affected by the zoom level on mobile browsers. The click function also uses HTML pixel coordinates for all DomElements. We recommend to use GetHtmlRect for all position calculations within the browser. This will ensure that your scripts are cross-browser capable and your position calculations are not effected by changing zoom levels on mobile browsers. (Inherited from DomElement)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetText	Gets the visible text of a DOM element. (Inherited from DomElement)
Highlight	Highlights a DOM element. (Inherited from DomElement)
HighlightObject	Highlights this object. (Inherited from TestObject)

Name	Description
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the DOM element into the visible area of the browser window. (Inherited from DomElement)
Select	Clicks a link.
SetDomAttribute	Sets the value of an object specific DOM attribute. (Inherited from DomElement)
SetFocus	Gives focus to the control. (Inherited from BrowserObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)

Name	Description
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
Unhighlight	Restores the original foreground and background colors. (Inherited from DomElement)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

DomListBox Class

Description

A `DomListBox` represents all DOM elements that were specified using the `<select>` tag.

Inheritance Hierarchy

- [DomElement](#)
 - DomListBox

Syntax

```
'Declaration
Public Class DomListBox _
Inherits DomElement _
Implements IItemSelectable
```

Properties

Name	Description
AllowsMultiSelect	whether the control is multiselectable.
IsFocused	Whether the DOM element has focus. (Inherited from DomElement)
ItemCount	the number of items in the listbox. (Inherited from IItemSelectable)
Items	the list of items in the listbox. (Inherited from IItemSelectable)
SelectedIndices	The indices of the selected item(s).
SelectedItems	The names of the selected item(s).
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from BrowserObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DomClick	Invokes a click using the DOM API. Alternatively you can invoke the Click function which will use low level replay for DomElements and subclasses. (Inherited from DomElement)
DomDoubleClick	Invokes a double click using the DOM API. Alternatively you can invoke the DoubleClick function which will use low level replay for

Name	Description
	DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from DomElement)
DomMouseMove	Invokes a mouse move using the DOM API. Alternatively you can use <code>MouseMove</code> function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from DomElement)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
ExecuteJavaScript	Evaluates the given JavaScript code within the parent document's context. (Inherited from DomElement)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <code>timeout</code> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <code>false</code> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetCssStyle	Retrieves the computed CSS style with the specified style name. (Inherited from DomElement)
GetDomAttribute	Gets the value of an object specific DOM attribute. (Inherited from DomElement)
GetDomAttributeList	Returns the names of all DOM attributes that are available for this element. This method is not supported for mobile Web applications. (Inherited from DomElement)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetHtmlRect	Retrieves the rectangle of a DomElement relative to the BrowserWindow in HTML pixels. In contrast to the screen coordinates that are provided by the <code>GetRect</code> function, the coordinates provided by <code>GetHtmlRect</code> are not affected by the zoom level on mobile browsers. The <code>click</code> function also uses HTML pixel coordinates for all DomElements. We recommend to use <code>GetHtmlRect</code> for all position calculations within the browser. This will ensure that your scripts are cross-browser capable and your position calculations are not effected by changing zoom levels on mobile browsers. (Inherited from DomElement)

Name	Description
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetText	Gets the visible text of a DOM element. (Inherited from DomElement)
Highlight	Highlights a DOM element. (Inherited from DomElement)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
MultiSelect	Selects a list of items.
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the DOM element into the visible area of the browser window. (Inherited from DomElement)

Name	Description
Select	Selects an item. (Inherited from IItemSelectable)
SetDomAttribute	Sets the value of an object specific DOM attribute. (Inherited from DomElement)
SetFocus	Gives focus to the control. (Inherited from BrowserObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
Unhighlight	Restores the original foreground and background colors. (Inherited from DomElement)
Unselect	Unselects an item.
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option

Name	Description
WaitForPropertyNotEquals	OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

DomRadioButton Class

Description

A DomRadioButton represents all DOM elements that were specified using <input type='radio'> tag.

Inheritance Hierarchy

- [DomElement](#)
 - DomRadioButton

Syntax

```
'Declaration
Public Class DomRadioButton _
Inherits DomElement
```

Properties

Name	Description
IsFocused	Whether the DOM element has focus. (Inherited from DomElement)
RadioListItemCount	The number of items in the radiolist. This property is not supported for mobile Web applications.
RadioListItems	the list of items in the radio list
RadioListSelectedIndex	The index of the selected item. Setter for this property was removed with Silk Test 17.5, as it was never functional. This property is not supported for mobile Web applications.
RadioListSelectedItem	The item that is selected in the radiolist. Setter for this property was removed with Silk Test 17.5, as it was never functional. This property is not supported for mobile Web applications.
Selected	whether the radio button is selected.
Text	The text of the control. (Inherited from TestObject)

Name	Description
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from BrowserObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DomClick	Invokes a click using the DOM API. Alternatively you can invoke the Click function which will use low level replay for DomElements and subclasses. (Inherited from DomElement)
DomDoubleClick	Invokes a double click using the DOM API. Alternatively you can invoke the DoubleClick function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from DomElement)
DomMouseMove	Invokes a mouse move using the DOM API. Alternatively you can use MouseMove function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from DomElement)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
ExecuteJavaScript	Evaluates the given JavaScript code within the parent document's context. (Inherited from DomElement)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)

Name	Description
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetCssStyle	Retrieves the computed CSS style with the specified style name. (Inherited from DomElement)
GetDomAttribute	Gets the value of an object specific DOM attribute. (Inherited from DomElement)
GetDomAttributeList	Returns the names of all DOM attributes that are available for this element. This method is not supported for mobile Web applications. (Inherited from DomElement)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetHtmlRect	Retrieves the rectangle of a DomElement relative to the BrowserWindow in HTML pixels. In contrast to the screen coordinates that are provided by the GetRect function, the coordinates provided by GetHtmlRect are not affected by the zoom level on mobile browsers. The click function also uses HTML pixel coordinates for all DomElements. We recommend to use GetHtmlRect for all position calculations within the browser. This will ensure that your scripts are cross-browser capable and your position calculations are not effected by changing zoom levels on mobile browsers. (Inherited from DomElement)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetText	Gets the visible text of a DOM element. (Inherited from DomElement)
Highlight	Highlights a DOM element. (Inherited from DomElement)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)

Name	Description
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from <i>TestObject</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>PressKeys</i>	Presses (but does not release) a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>PressMouse</i>	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>RadioListSelect</i>	Selects an item in the radio list.
<i>ReleaseKeys</i>	Releases a set of keys or mouse buttons. (Inherited from <i>IKeyable</i>)
<i>ReleaseMouse</i>	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)
<i>ScrollIntoView</i>	Scrolls the DOM element into the visible area of the browser window. (Inherited from <i>DomElement</i>)
<i>Select</i>	Selects the radio button.
<i>SetDomAttribute</i>	Sets the value of an object specific DOM attribute. (Inherited from <i>DomElement</i>)
<i>SetFocus</i>	Gives focus to the control. (Inherited from <i>BrowserObject</i>)
<i>SetProperty</i>	Sets the value of the specified property. (Inherited from <i>TestObject</i>)
<i>TextCapture</i>	Returns the text in this object's visible area. (Inherited from <i>TestObject</i>)
<i>TextClick</i>	Clicks in the center of the specified text. (Inherited from <i>TestObject</i>)
<i>TextExists</i>	Returns whether the specified text exists. (Inherited from <i>TestObject</i>)
<i>TextRectangle</i>	Returns the object-relative rectangle of the specified text. (Inherited from <i>TestObject</i>)
<i>TypeKeys</i>	Sends a set of keystrokes to the object. (Inherited from <i>IKeyable</i>)
<i>TypePasswordKeys</i>	Types an encrypted password into an object, for example a text field. (Inherited from <i>IKeyable</i>)
<i>Unhighlight</i>	Restores the original foreground and background colors. (Inherited from <i>DomElement</i>)

Name	Description
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

DomTable Class

Description

A `DomTable` represents the `<table>` tag. All methods and properties in this class are not supported for mobile Web applications.

Inheritance Hierarchy

- [DomElement](#)

- DomTable

Syntax

```
'Declaration
Public Class DomTable _
Inherits DomElement
```

Properties

Name	Description
<i>IsFocused</i>	Whether the DOM element has focus. (Inherited from <i>DomElement</i>)
<i>Text</i>	The text of the control. (Inherited from <i>TestObject</i>)
<i>Value</i>	The value of the control, e.g.: text in a text control. (Inherited from <i>TestObject</i>)
<i>Visible</i>	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from <i>BrowserObject</i>)

Methods

Name	Description
<i>CaptureBitmap</i>	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from <i>TestObject</i>)
<i>Click</i>	Clicks on the object. (Inherited from <i>IClickable</i>)
<i>DomClick</i>	Invokes a click using the DOM API. Alternatively you can invoke the Click function which will use low level replay for DomElements and subclasses. (Inherited from <i>DomElement</i>)
<i>DomDoubleClick</i>	Invokes a double click using the DOM API. Alternatively you can invoke the DoubleClick function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from <i>DomElement</i>)
<i>DomMouseMove</i>	Invokes a mouse move using the DOM API. Alternatively you can use MouseMove function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from <i>DomElement</i>)
<i>DoubleClick</i>	Double-clicks a mouse button on the object. (Inherited from <i>IClickable</i>)
<i>ExecuteJavaScript</i>	Evaluates the given JavaScript code within the parent document's context. (Inherited from <i>DomElement</i>)

Name	Description
<i>Exists</i>	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from <i>TestObject</i>)
<i>Exists</i>	Checks if an object exists in the application under test. (Inherited from <i>TestObject</i>)
<i>Find</i>	Finds an object specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>FindAll</i>	Finds all objects specified by an XPath locator. (Inherited from <i>TestObject</i>)
<i>GenerateLocator</i>	Returns a locator for this object. (Inherited from <i>TestObject</i>)
<i>GetCell</i>	Returns the specified cell.
<i>GetCellText</i>	Returns the content of a cell element.
<i>GetChildren</i>	Returns the child objects of this object. (Inherited from <i>TestObject</i>)
<i>GetColumnCount</i>	Number of columns of the table.
<i>GetCssStyle</i>	Retrieves the computed CSS style with the specified style name. (Inherited from <i>DomElement</i>)
<i>GetDomAttribute</i>	Gets the value of an object specific DOM attribute. (Inherited from <i>DomElement</i>)
<i>GetDomAttributeList</i>	Returns the names of all DOM attributes that are available for this element. This method is not supported for mobile Web applications. (Inherited from <i>DomElement</i>)
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from <i>TestObject</i>)
<i>GetHtmlRect</i>	Retrieves the rectangle of a DomElement relative to the BrowserWindow in HTML pixels. In contrast to the screen coordinates that are provided by the GetRect function, the coordinates provided by GetHtmlRect are not affected by the zoom level on mobile browsers. The click function also uses HTML pixel coordinates for all DomElements. We recommend to use GetHtmlRect for all position calculations within the browser. This will ensure that your scripts are cross-browser capable and your position calculations are not effected by changing zoom levels on mobile browsers. (Inherited from <i>DomElement</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)

Name	Description
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetRow	Returns the DOM element for the specified row.
GetRowCount	Returns the number of rows
GetRows	Returns a list of rows (DomTableRows)
GetRowText	Returns the content of all cell elements of a specified row.
GetText	Gets the visible text of a DOM element. (Inherited from DomElement)
Highlight	Highlights a DOM element. (Inherited from DomElement)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the DOM element into the visible area of the browser window. (Inherited from DomElement)
SetDomAttribute	Sets the value of an object specific DOM attribute. (Inherited from DomElement)

Name	Description
SetFocus	Gives focus to the control. (Inherited from BrowserObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
Unhighlight	Restores the original foreground and background colors. (Inherited from DomElement)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used.

Name	Description
	An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option OPT_WAIT_RESOLVE_OBJDEF will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

DomTableRow Class

Description

A DomTableRow represents the <tr> tag. All methods and properties in this class are not supported for mobile Web applications.

Inheritance Hierarchy

- [DomElement](#)
 - DomTableRow

Syntax

```
'Declaration
Public Class DomTableRow _
Inherits DomElement
```

Properties

Name	Description
IsFocused	Whether the DOM element has focus. (Inherited from DomElement)
Text	The text of the control. (Inherited from TestObject)
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from BrowserObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant

Name	Description
	<i>System.Drawing.Imaging.PixelFormat.Format32bppRgb</i> can be used for this purpose. (Inherited from TestObject)
Click	Clicks on the object. (Inherited from IClickable)
DomClick	Invokes a click using the DOM API. Alternatively you can invoke the Click function which will use low level replay for DomElements and subclasses. (Inherited from DomElement)
DomDoubleClick	Invokes a double click using the DOM API. Alternatively you can invoke the DoubleClick function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from DomElement)
DomMouseMove	Invokes a mouse move using the DOM API. Alternatively you can use MouseMove function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from DomElement)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
ExecuteJavaScript	Evaluates the given JavaScript code within the parent document's context. (Inherited from DomElement)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetCell	Returns the DOM element in the given cell.
GetCellCount	Returns the number of cells in this table row
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetCssStyle	Retrieves the computed CSS style with the specified style name. (Inherited from DomElement)
GetDomAttribute	Gets the value of an object specific DOM attribute. (Inherited from DomElement)
GetDomAttributeList	Returns the names of all DOM attributes that are available for this element. This method is not supported for mobile Web applications. (Inherited from DomElement)

Name	Description
<i>GetDynamicMethodList</i>	Returns a list of methods (including their signature) that can be dynamically invoked on this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>GetHtmlRect</i>	Retrieves the rectangle of a <i>DomElement</i> relative to the <i>BrowserWindow</i> in HTML pixels. In contrast to the screen coordinates that are provided by the <i>GetRect</i> function, the coordinates provided by <i>GetHtmlRect</i> are not affected by the zoom level on mobile browsers. The <i>click</i> function also uses HTML pixel coordinates for all <i>DomElements</i> . We recommend to use <i>GetHtmlRect</i> for all position calculations within the browser. This will ensure that your scripts are cross-browser capable and your position calculations are not effected by changing zoom levels on mobile browsers. (Inherited from <i>DomElement</i>)
<i>GetParent</i>	Looks up the parent of this object in the test application. (Inherited from <i>TestObject</i>)
<i>GetProperty</i>	Returns the value of the specified property. (Inherited from <i>TestObject</i>)
<i>GetPropertyList</i>	Returns a list of property names that can be retrieved for the given object. (Inherited from <i>TestObject</i>)
<i>GetRect</i>	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from <i>TestObject</i>)
<i>GetText</i>	Gets the visible text of a DOM element. (Inherited from <i>DomElement</i>)
<i>Highlight</i>	Highlights a DOM element. (Inherited from <i>DomElement</i>)
<i>HighlightObject</i>	Highlights this object. (Inherited from <i>TestObject</i>)
<i>ImageClick</i>	Clicks on specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageClickFile</i>	Clicks on the specified image. (Inherited from <i>TestObject</i>)
<i>ImageExists</i>	Returns whether the specified image asset exists. (Inherited from <i>TestObject</i>)
<i>ImageExistsFile</i>	Returns whether the specified image exists. (Inherited from <i>TestObject</i>)
<i>ImageRectangle</i>	Returns the object-relative rectangle of the specified image asset. (Inherited from <i>TestObject</i>)
<i>ImageRectangleFile</i>	Returns the object-relative rectangle of the specified image. (Inherited from <i>TestObject</i>)
<i>Invoke</i>	Dynamically invokes a method on the test object. (Inherited from <i>TestObject</i>)
<i>InvokeMethods</i>	Dynamically invokes a sequence of methods starting at this <i>TestObject</i> . (Inherited from <i>TestObject</i>)
<i>MouseMove</i>	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from <i>IClickable</i>)

Name	Description
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the DOM element into the visible area of the browser window. (Inherited from DomElement)
SetDomAttribute	Sets the value of an object specific DOM attribute. (Inherited from DomElement)
SetFocus	Gives focus to the control. (Inherited from BrowserObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
Unhighlight	Restores the original foreground and background colors. (Inherited from DomElement)
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Name	Description
	results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

DomTextField Class

Description

A `DomTextField` represents DOM elements that were specified using one of the following tags: `<input type='text'>`, `<input type='password'>`, `<input type='file'>` or `<textarea>`.

Inheritance Hierarchy

- [DomElement](#)
 - `DomTextField`
 - [DomDataList](#)

Syntax

```
'Declaration
Public Class DomTextField _
Inherits DomElement
```

Properties

Name	Description
IsFocused	Whether the DOM element has focus. (Inherited from DomElement)
IsPassword	whether the text field is a password text field.
Text	The text of the control. (Inherited from TestObject)

Name	Description
Value	The value of the control, e.g.: text in a text control. (Inherited from TestObject)
Visible	Whether the object is visible. You can only locate visible objects, so by default the value is always <i>true</i> . However, you might need this property when an already located object in the application under test gets invisible during replay. (Inherited from BrowserObject)

Methods

Name	Description
CaptureBitmap	Saves a bitmap image of this object to a file. If you do not specify an absolute file name, the bitmap is saved to the default bitmap location on the machine that runs the Agent, which is %LOCALAPPDATA%/Silk/SilkTest/capturedBitmaps. The captured bitmap's pixels are stored in 32bit RGB order; when parsing the image the 4th byte (alpha channel) of every pixel must be ignored as it is used only for padding. In .NET, the constant <code>System.Drawing.Imaging.PixelFormat.Format32bppRgb</code> can be used for this purpose. (Inherited from TestObject)
ClearText	Clears the textfield's text
Click	Clicks on the object. (Inherited from IClickable)
DomClick	Invokes a click using the DOM API. Alternatively you can invoke the Click function which will use low level replay for DomElements and subclasses. (Inherited from DomElement)
DomDoubleClick	Invokes a double click using the DOM API. Alternatively you can invoke the DoubleClick function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from DomElement)
DomMouseMove	Invokes a mouse move using the DOM API. Alternatively you can use MouseMove function which will use low level replay for DomElements and subclasses. This method is not supported for mobile Web applications. (Inherited from DomElement)
DoubleClick	Double-clicks a mouse button on the object. (Inherited from IClickable)
ExecuteJavaScript	Evaluates the given JavaScript code within the parent document's context. (Inherited from DomElement)
Exists	Checks if any child object matching the locator exists for an object in the application under test. If the <i>timeout</i> parameter is passed the agent retries finding until the given timeout expires. If no timeout is specified and no object is found initially <i>false</i> is returned immediately. (Inherited from TestObject)
Exists	Checks if an object exists in the application under test. (Inherited from TestObject)
Find	Finds an object specified by an XPath locator. (Inherited from TestObject)

Name	Description
FindAll	Finds all objects specified by an XPath locator. (Inherited from TestObject)
GenerateLocator	Returns a locator for this object. (Inherited from TestObject)
GetChildren	Returns the child objects of this object. (Inherited from TestObject)
GetCssStyle	Retrieves the computed CSS style with the specified style name. (Inherited from DomElement)
GetDomAttribute	Gets the value of an object specific DOM attribute. (Inherited from DomElement)
GetDomAttributeList	Returns the names of all DOM attributes that are available for this element. This method is not supported for mobile Web applications. (Inherited from DomElement)
GetDynamicMethodList	Returns a list of methods (including their signature) that can be dynamically invoked on this TestObject. (Inherited from TestObject)
GetHtmlRect	Retrieves the rectangle of a DomElement relative to the BrowserWindow in HTML pixels. In contrast to the screen coordinates that are provided by the GetRect function, the coordinates provided by GetHtmlRect are not affected by the zoom level on mobile browsers. The click function also uses HTML pixel coordinates for all DomElements. We recommend to use GetHtmlRect for all position calculations within the browser. This will ensure that your scripts are cross-browser capable and your position calculations are not effected by changing zoom levels on mobile browsers. (Inherited from DomElement)
GetParent	Looks up the parent of this object in the test application. (Inherited from TestObject)
GetProperty	Returns the value of the specified property. (Inherited from TestObject)
GetPropertyList	Returns a list of property names that can be retrieved for the given object. (Inherited from TestObject)
GetRect	Returns the size and position of this object. Per default the returned coordinates are relative to the parent window that contains this object. (Inherited from TestObject)
GetText	Gets the visible text of a DOM element. (Inherited from DomElement)
Highlight	Highlights a DOM element. (Inherited from DomElement)
HighlightObject	Highlights this object. (Inherited from TestObject)
ImageClick	Clicks on specified image asset. (Inherited from TestObject)
ImageClickFile	Clicks on the specified image. (Inherited from TestObject)
ImageExists	Returns whether the specified image asset exists. (Inherited from TestObject)

Name	Description
ImageExistsFile	Returns whether the specified image exists. (Inherited from TestObject)
ImageRectangle	Returns the object-relative rectangle of the specified image asset. (Inherited from TestObject)
ImageRectangleFile	Returns the object-relative rectangle of the specified image. (Inherited from TestObject)
Invoke	Dynamically invokes a method on the test object. (Inherited from TestObject)
InvokeMethods	Dynamically invokes a sequence of methods starting at this TestObject. (Inherited from TestObject)
MouseMove	Moves the pointer to the specified location in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
PressKeys	Presses (but does not release) a set of keys or mouse buttons. (Inherited from IKeyable)
PressMouse	Presses (but does not release) a mouse button in the object. This method is not supported for mobile Web applications. (Inherited from IClickable)
ReleaseKeys	Releases a set of keys or mouse buttons. (Inherited from IKeyable)
ReleaseMouse	Releases a mouse button. This method is not supported for mobile Web applications. (Inherited from IClickable)
ScrollIntoView	Scrolls the DOM element into the visible area of the browser window. (Inherited from DomElement)
SetDomAttribute	Sets the value of an object specific DOM attribute. (Inherited from DomElement)
SetFocus	Gives focus to the control. (Inherited from BrowserObject)
SetProperty	Sets the value of the specified property. (Inherited from TestObject)
SetText	Sets the text.
TextCapture	Returns the text in this object's visible area. (Inherited from TestObject)
TextClick	Clicks in the center of the specified text. (Inherited from TestObject)
TextExists	Returns whether the specified text exists. (Inherited from TestObject)
TextRectangle	Returns the object-relative rectangle of the specified text. (Inherited from TestObject)
TypeKeys	Sends a set of keystrokes to the object. (Inherited from IKeyable)
TypePasswordKeys	Types an encrypted password into an object, for example a text field. (Inherited from IKeyable)
Unhighlight	Restores the original foreground and background colors. (Inherited from DomElement)

Name	Description
WaitForChildDisappearance	Waits until the specified child object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForDisappearance	Waits until the object does not exist or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForObject	Waits for an object that matches the specified locator. If no object matches within an timeout an <code>ObjectNotFoundException</code> is thrown. The default timeout is 5 seconds and you can change the timeout by setting the value of the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> . Use <code>WaitForObject</code> if the AUT takes a long time to display a specific object, for example when a transaction is processed before showing any results. By default, an action in the UI does not require a <code>WaitForObject</code> , because of the built-in synchronization. If you receive random timeout errors during normal script execution, consider increasing the default timeout instead of adding <code>WaitForObject</code> statements to your scripts. (Inherited from TestObject)
WaitForProperty	Waits until the specified property has the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForPropertyNotEquals	Waits until the specified property has a value that is different to the specified value or until the timeout is reached. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. An exception is thrown if the timeout is reached. (Inherited from TestObject)
WaitForScreenshotStable	Waits until the control is visually stable and does not change its position, by comparing screenshots taken with the specified interval. If you don't explicitly pass a timeout using the optional timeout parameter, the timeout specified by the option <code>OPT_WAIT_RESOLVE_OBJDEF</code> will be used. The default interval is 200 milliseconds. An exception is thrown if the timeout is reached. (Inherited from TestObject)

ItemSelectable Interface

Description

A `ItemSelectable` provides a list of items of which one can be selected.

Syntax

```
'Declaration
Public Class IItemSelectable
```

Properties

Name	Description
<i>ItemCount</i>	the number of items in the listbox.
<i>Items</i>	the list of items in the listbox.

Methods

Name	Description
<i>Select</i>	Selects an item.
